

# Neil Martin

Senior Desktop Support Specialist

University of East London

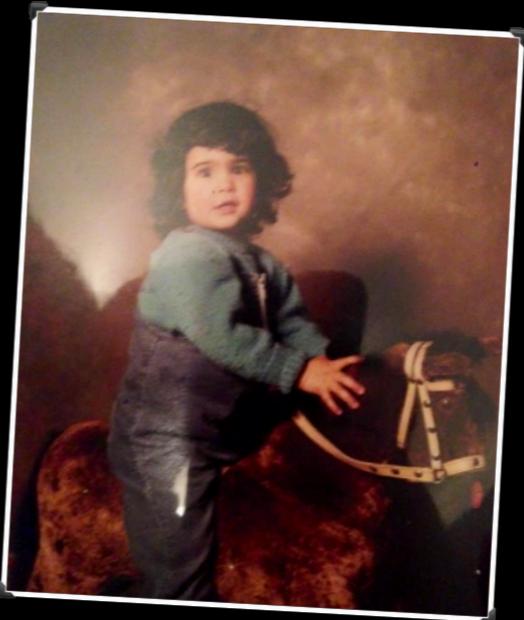

@neilmartin83

[soundmacguy.wordpress.com](http://soundmacguy.wordpress.com)

[www.londonappleadmins.org.uk](http://www.londonappleadmins.org.uk)

I'm Neil and I work in the End User Compute team which is part of IT Services at UEL. Like lots of folks working with Apple stuff in enterprise IT, I don't have an IT background - I actually used to be a sound engineer...

<C> I'm also an admin on the Slack, where you may know me as this person.

I'd like to give a shout out to the London Apple Admins community - if you're in town come along to our next meet up which will be at Jigsaw on the 12th of April!

If you want to know more about what we do, check out our website and come and say hello to one of our herders - Ben Toms, Darren Wallace, Graham Gilbert, Steve Quirke or me.

We're always on the look out for future venues and speakers.

## The University of East London

- Over 19,000 students
- 3 campuses
- 470 Macs, 200 in labs
- 2015 - 2018, Jamf Pro
- April 2018, Jamf Cloud

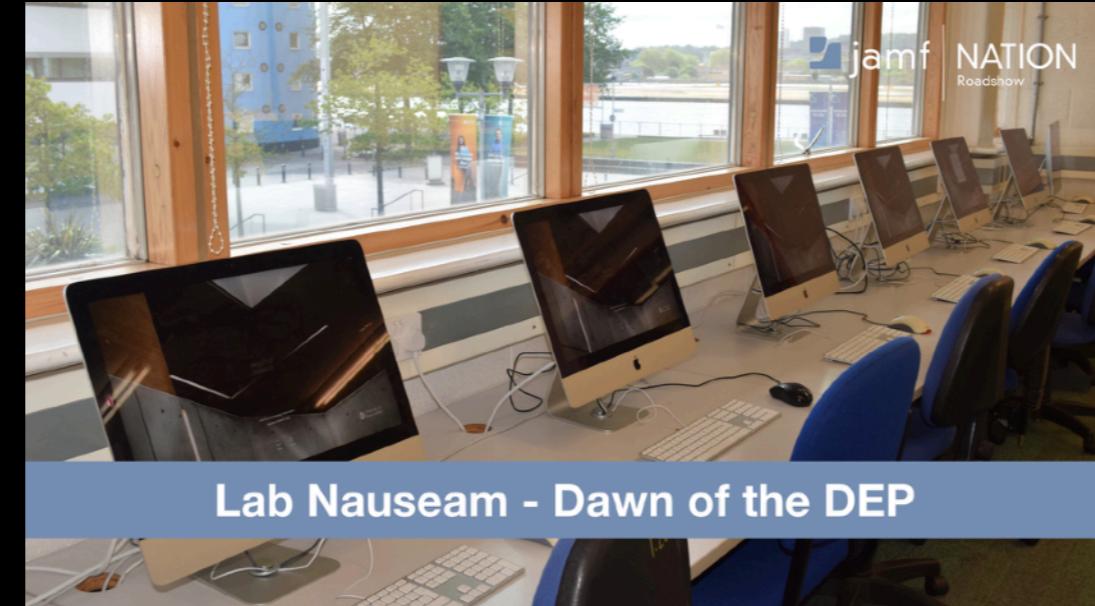

UEL has more than 19,000 students, spread over our Docklands, Stratford and University Square Stratford campuses.

My team manages around 5,000 PCs, with Macs making up about 10% of the estate. On both platforms, we're responsible for 2 key sorts of experience - a 1-1 model for staff, and a shared "Lab" model for students.

We've been managing our Macs with Jamf Pro since 2015 and last year, we migrated to Jamf Cloud.

<https://soundmacguy.wordpress.com/2018/05/17/lab-nauseam-dawn-of-the-dep/>

Last May, I spoke at the Jamf Nation Roadshow in London.

I talked about the fun I had re-engineering our Mac provisioning process; how we moved away from the old modular imaging workflows. And how we got to grips with using Apple's modern methods, like the device enrolment programme, Apple School Manager and MDM. If you check out the link, you can read all about it.

# “Provisioning”

Our goal is to get our Macs deployed, configured and managed so they’re ready to give the experience we want to our students and staff. I’m lazy so I want to automate that as much as I can.

We use Jamf, so some of this talk will be specific to that. But for your environments, if you know what you want to achieve early on, you can definitely leverage these concepts in other management tools.

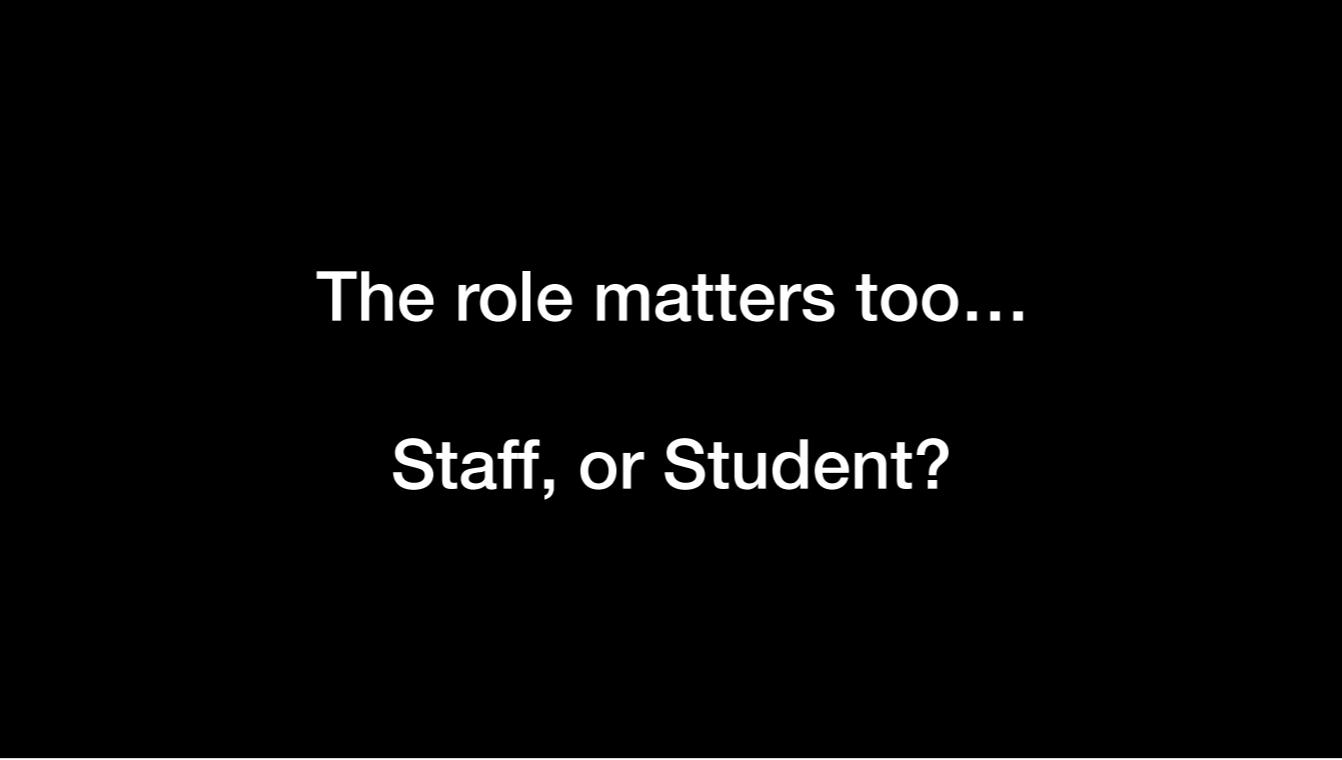

# The Hostname matters to us

To manage a Mac the way we want to, we need to know a bit more information about it. For us, one piece of information is its hostname. We don't just want to know it - we want to set it, because the naming convention we use defines how we'll manage our Macs.

DLEB285-12345

Campus (DL = Docklands)  
Building (EB = East Building)  
Room (2.85)  
Asset number (12345)

This is one of our typical hostnames. Let's pick it apart. Our naming convention tells us the <C> Campus (Docklands), <C> Building (East Building), <C>, Room number <C> and our own internal Asset number.

**The role matters too...**

**Staff, or Student?**

Along with the name, we need to know its role... Will the Mac sit in a member of staff's office and be used in a 1-1 setting? Is it going to be shared by lots of students in a lab? The experience we deliver is going to be different for each. So with Jamf, we'll make use of something called an extension attribute - that's the Jamf way of saying an extra piece of data about a computer we can define and collect. I would imagine other management tools probably have something similar.

Computers > Smart Computer Groups >  
All DL Student Macs

Computer Group Criteria

| AND/OR | CRITERIA      | OPERATOR | VALUE   |
|--------|---------------|----------|---------|
|        | Mac User Role | is       | Student |
| and    | Computer Name | like     | DL      |

+ Add

**DL**

With those two bits of information, we can create smart groups in Jamf, like this one, which will automatically populate with all the student facing Macs at our Docklands campus.

Computers > Smart Computer Groups >  
All DLEB Macs

Computer Group Criteria

| AND/OR | CRITERIA      | OPERATOR | VALUE |
|--------|---------------|----------|-------|
| ▼      | Computer Name | like ▼   | DLEB  |

+ Add

# DLEB

For all the Macs in the East Building at Docklands...

The screenshot shows the Jamf Pro interface for creating a Smart Computer Group. The group is named "Lab DLEB240". Under the "Criteria" tab, there is one defined criterion: "Computer Name like DLEB240". The "Criteria" column contains "Computer Name", the "Operator" column contains "like", and the "Value" column contains "DLEB240". The entire row for this criterion is highlighted with a red box.

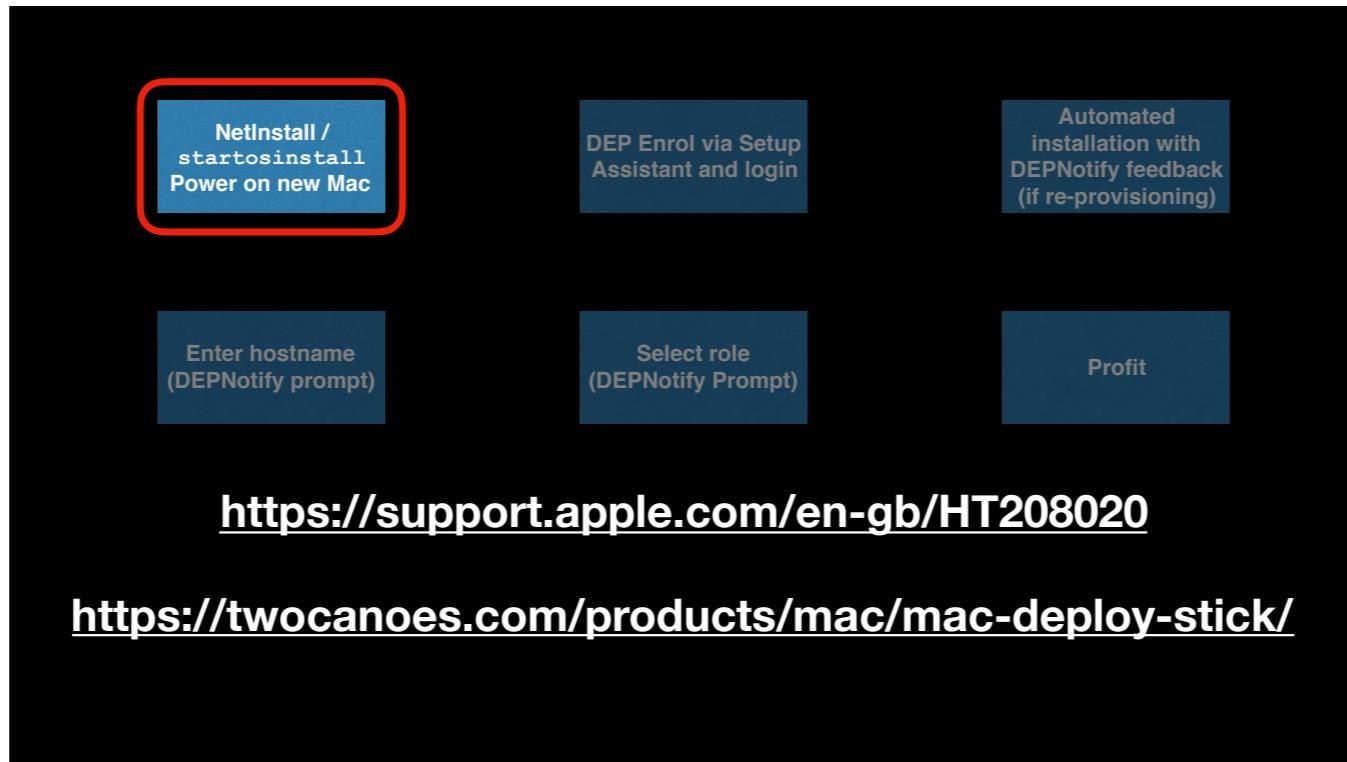

<https://github.com/neilmartin83/Jamf-Nation-Roadshow-London-2018>

# DLEB240

Or for a specific lab by its room number.

This kind of framework gives you a lot of flexibility when it comes to defining the software and settings you want to deploy to your computers, depending on who they're used by and where they are, or combinations thereof.

That's beyond the scope of this session but if it's something you're interested in, please do have a look at this link where I've gone into detail with an example of how you'd deploy applications using this model.

So, back to provisioning. Our previous workflow went something like this...

We begin with a fresh, clean install of macOS.

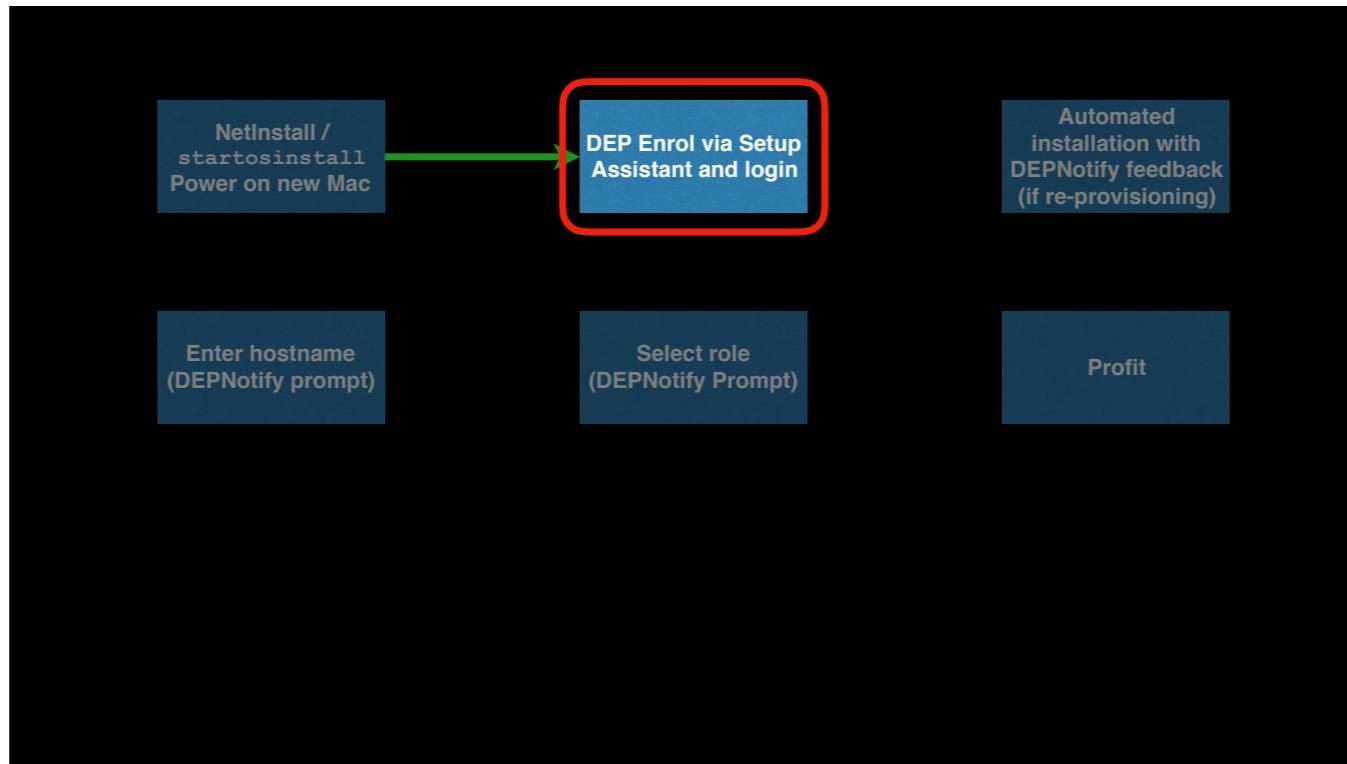

For a new Mac, that's easy - Apple have done that for you already.

If you're re-provisioning a Mac you're already managing, there are a few ways to achieve this. For our older Macs that don't have the T2 chip which is most of our labs, I still use NetInstall with Graham Gilbert's fantastic tool, Imagr to achieve a "vanilla" erase/install. But, once they go to Mojave, it'll be the end of NetBoot for us.

That's because, if the boot volume on your Mac is using the new APFS filesystem, you can use your management tool to deploy the macOS installer application and remotely run the startosinstall command with the eraseinstall flag.

As an aside, Tim Perfitt has recently done some fantastic work on a product called Mac Deployment Stick - you should definitely check that out too.

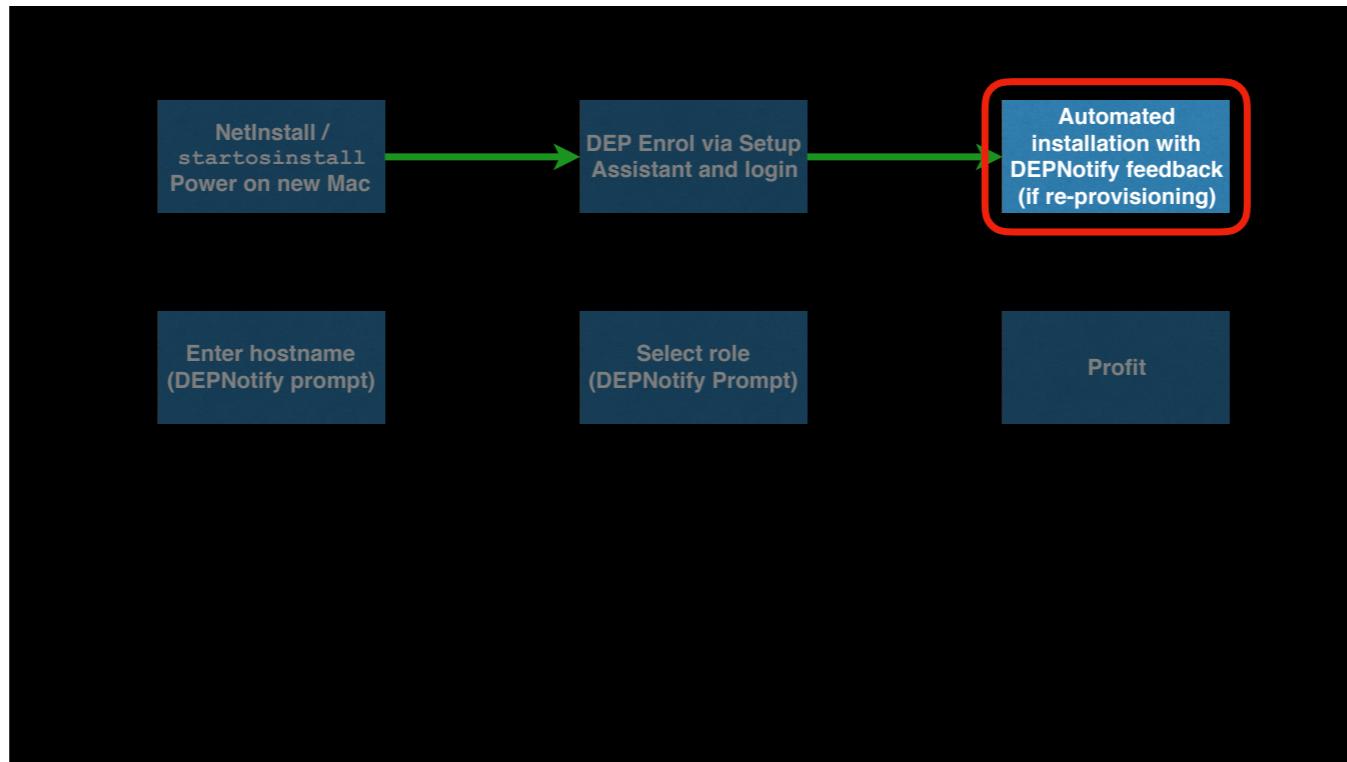

And of course, there's Internet Recovery, which I find is okay for one-offs, but it's not scalable when you've got dozens, hundreds or thousands of Macs to churn through, or if internet bandwidth is an issue for you.

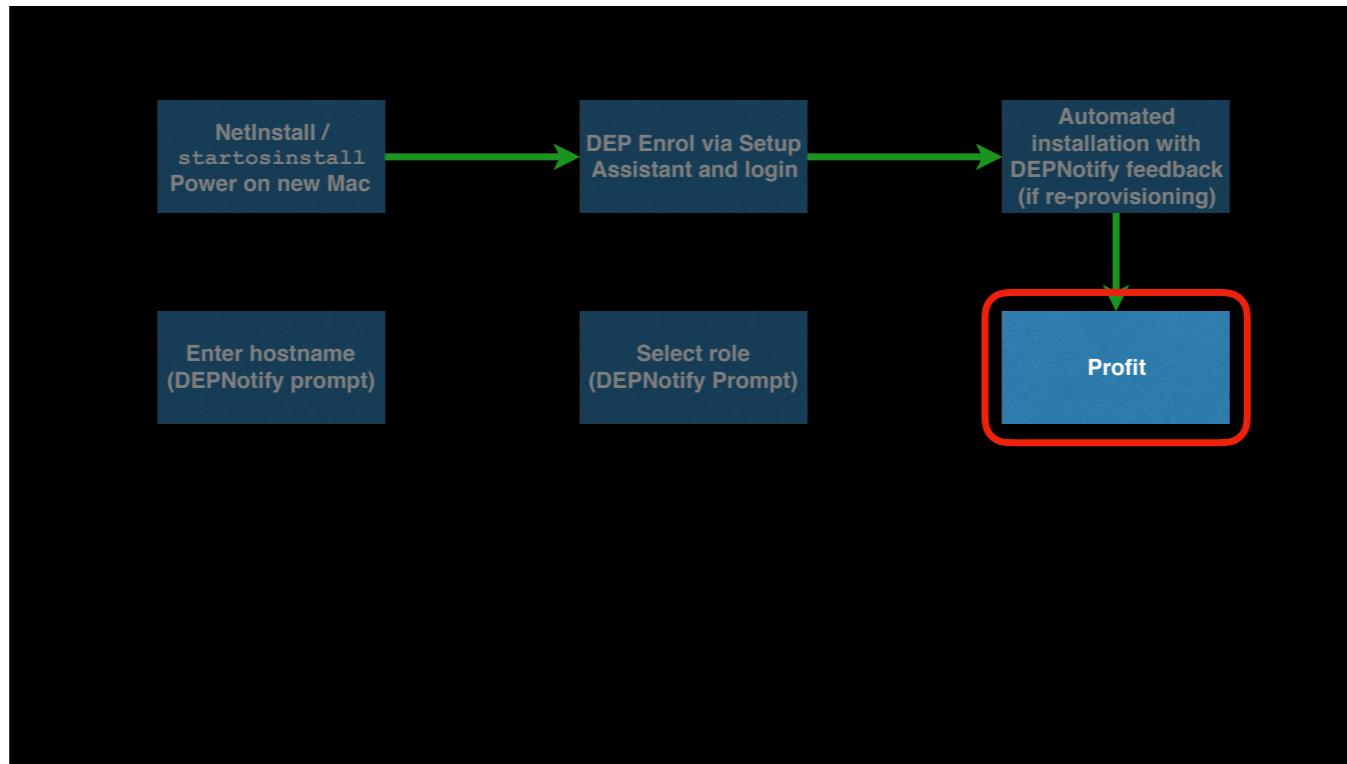

Next up was getting the fresh clean Mac under management - quite a few things happen here.

We use DEP, and assign them to a PreStage in Jamf.

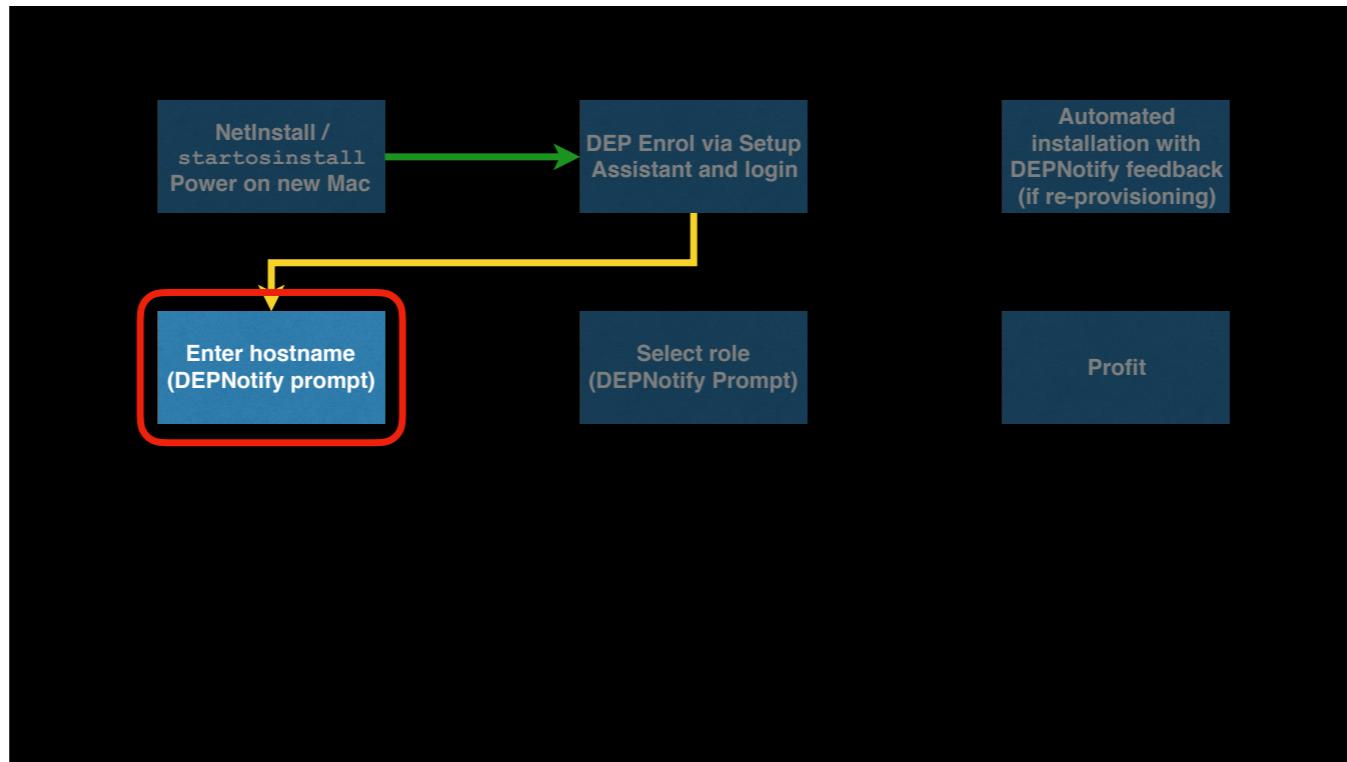

We skip all the steps of the setup assistant we can. We also bind to AD at this point so a technician can log in to continue the process. At this stage, a policy kicks off with the enrolment complete trigger and runs a script to drive the rest of the process.

Next up, we drove one of Joel's other awesome tools; DEPNotify, to get it to tell the provisioner what was happening. If the Mac had been provisioned before, and had an old record in Jamf - the rest was automated. We'd reuse its old hostname and role and it would get the same software and settings it had before.

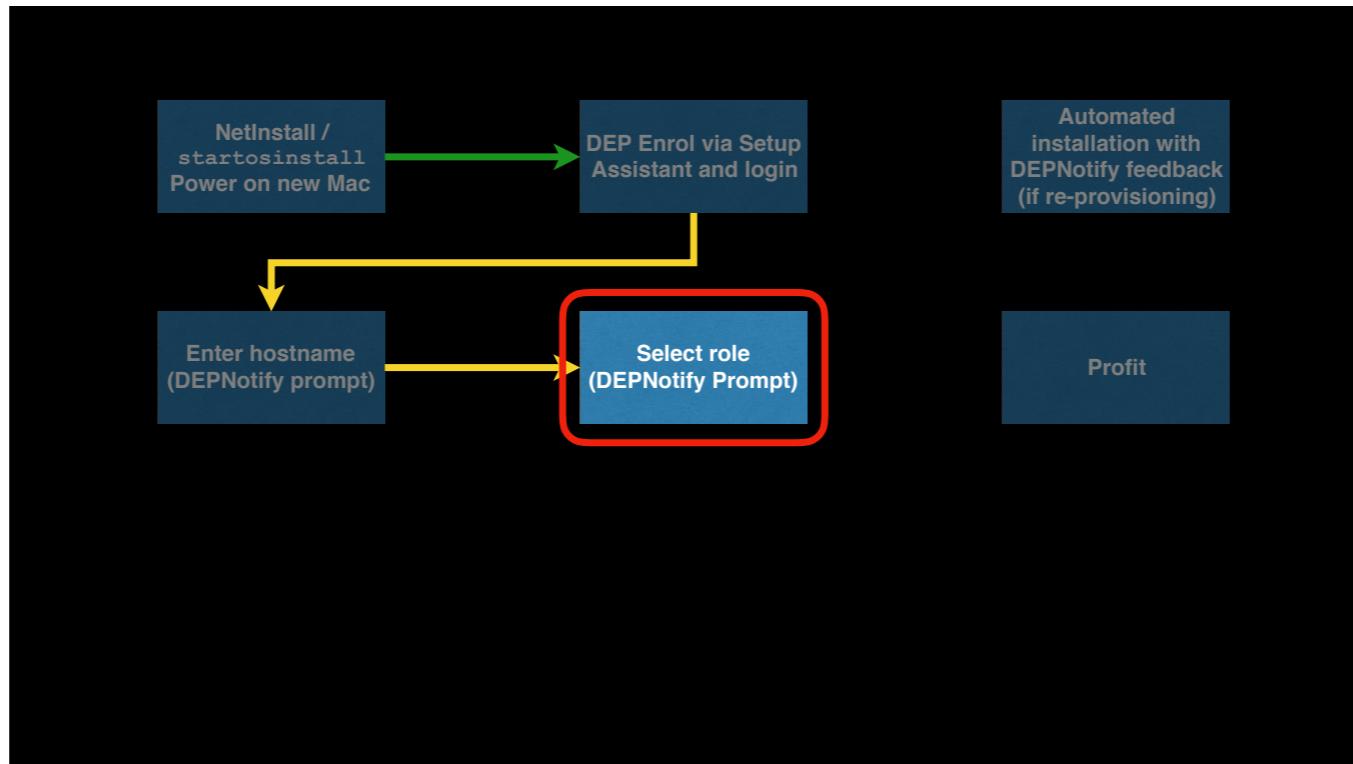

And then, the rest was magic and we'd walk away, job done.

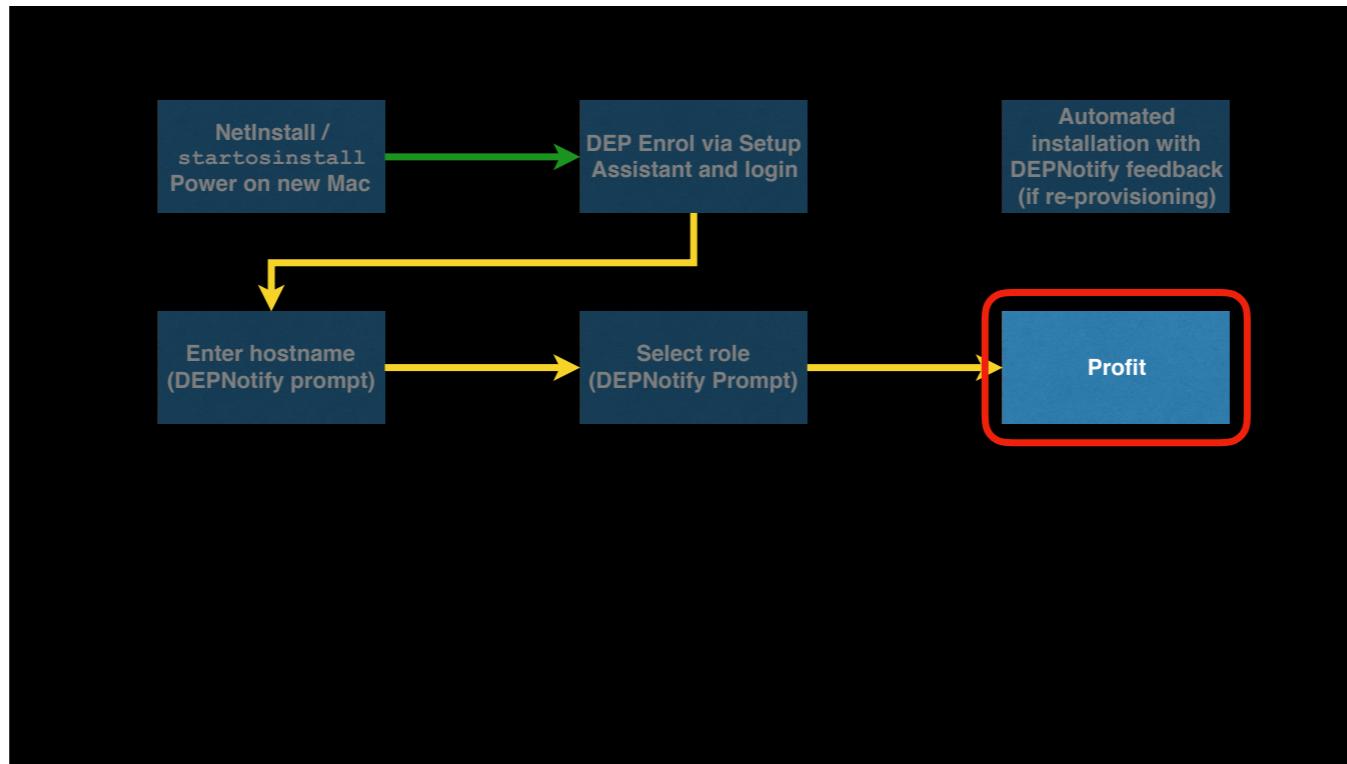

Now, in the case of a new Mac, or one we were re-purposing...

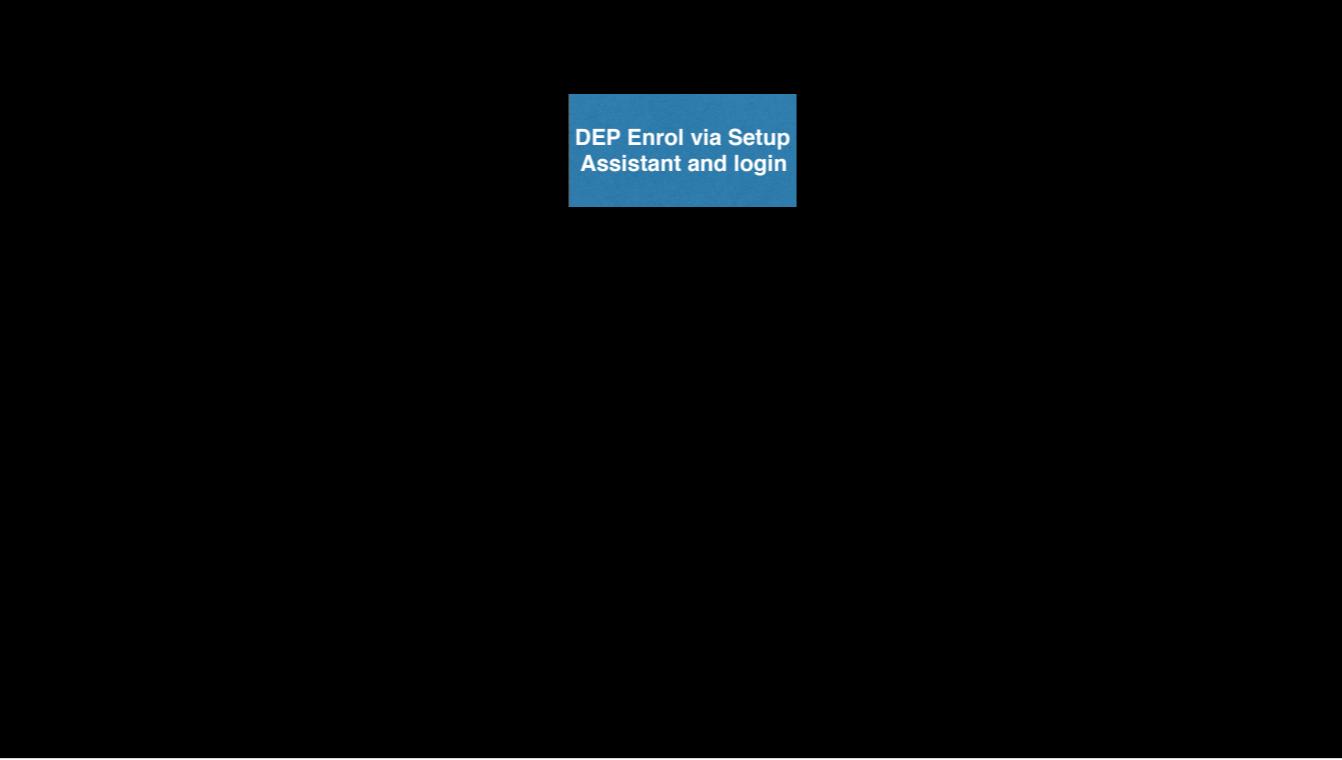

We'd delete its computer record so it was essentially new to Jamf. And in this situation, we would tell DEPNotify to ask our provisioner to input some information. So, the hostname.

And the role.

And then, the rest was magic...

DEP Enrol via Setup  
Assistant and login

But - there's room for improvement.

**DEP Enrol via Setup Assistant and login**

And when something's not quite right, it really plays on my mind...

login

And the conundrum going around my mind was: If you're just provisioning a computer for someone else to use, why should you need to log into it?

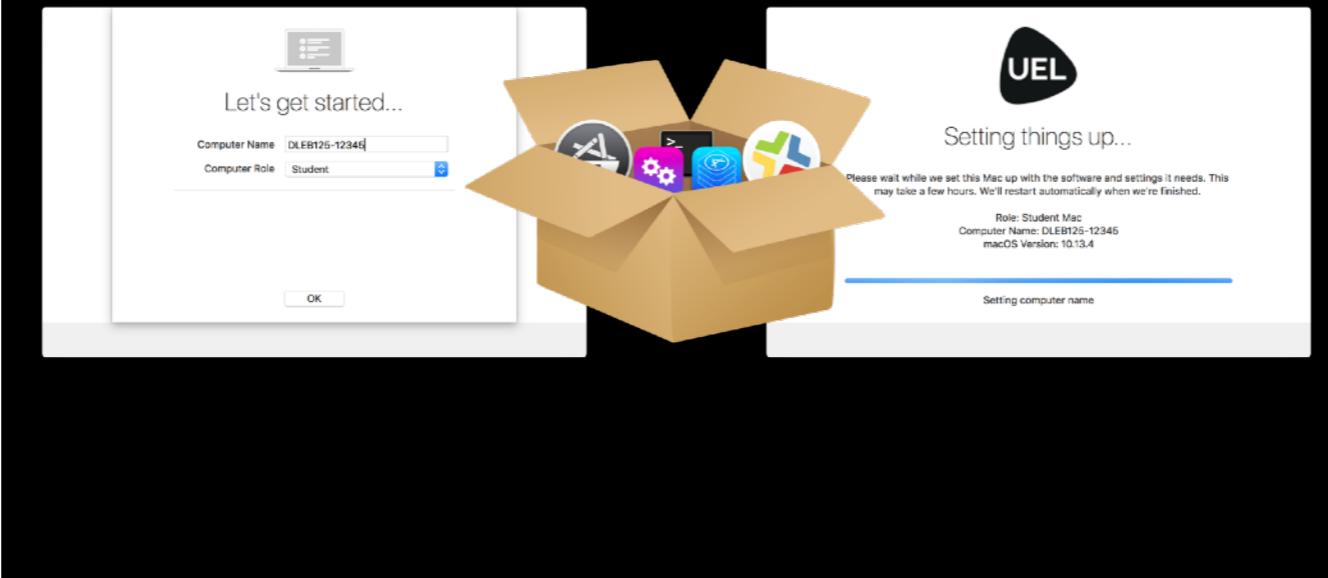

# The Setup Assistant isn't enough

It's because the Setup Assistant doesn't do everything we need it to do.

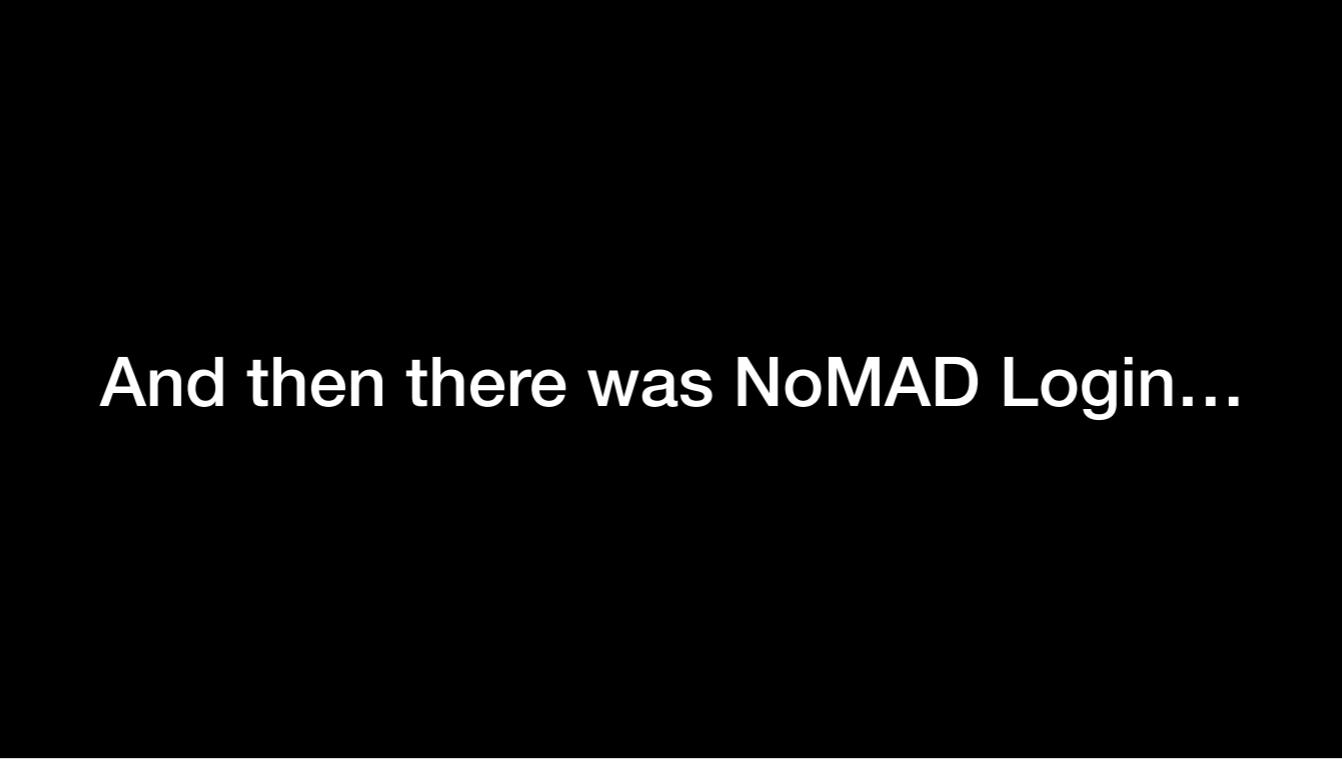

It doesn't let us provide extra information we need for our management tools to get the right things to it straight away.

It doesn't tell us what's happening, which software is being installed and so on...

# DEPNotify is awesome!

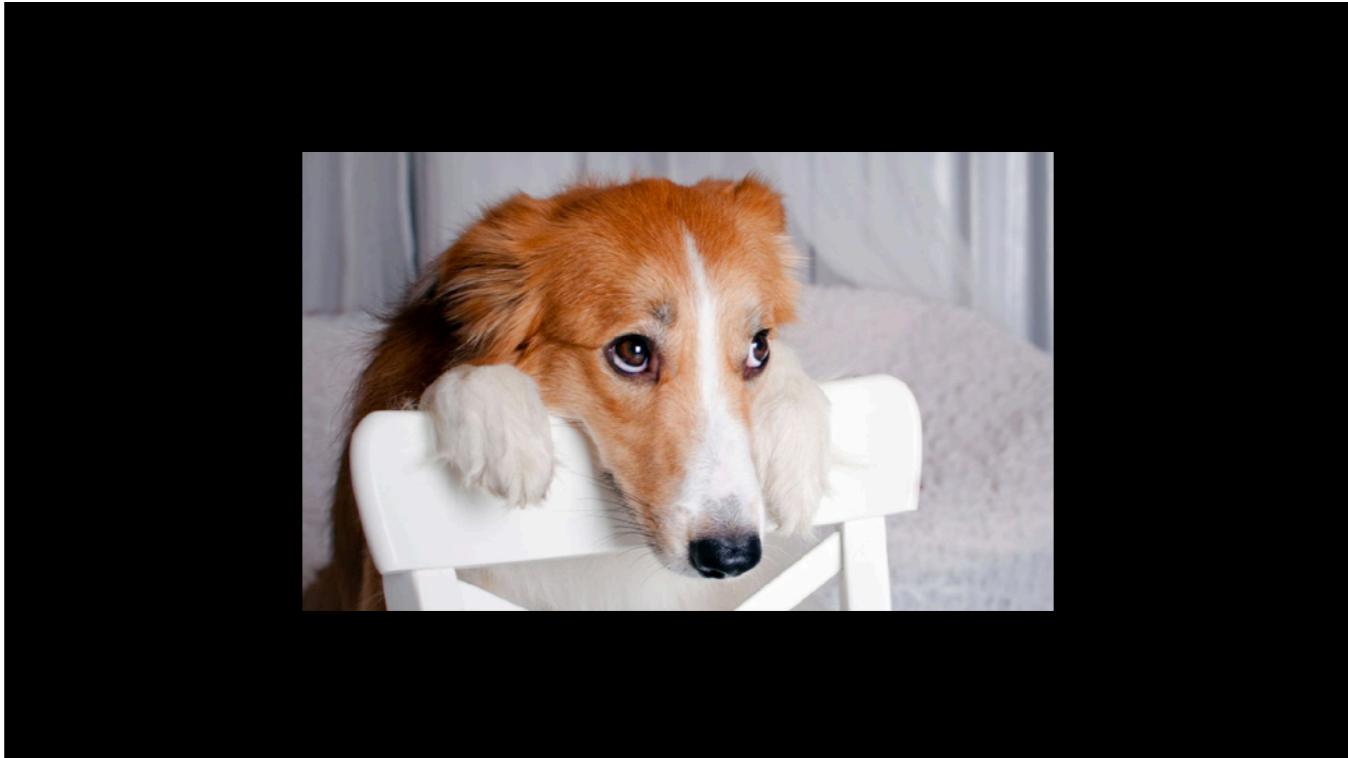

That's why, for my environment, DEPNotify really worked to extend the Setup Assistant.  
It gave us a way to supply extra information and it provided great feedback about what was happening .  
But... it would only run after a user had logged in.

**And then there was NoMAD Login...**

And this is why I'm here today. Because Joel and his fantastic team merged what DEPNotify does into NoMAD Login!

Now, please join me as we look at what happened next...

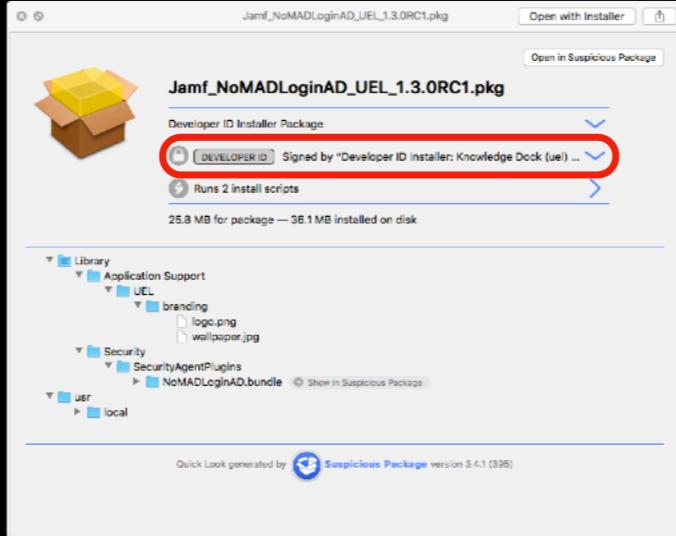

It's at this point I have a bit of a confession to make - I'm only using the Notify and User Input parts of NoMAD Login - right now, we're binding to AD and using mobile accounts, so I'm not yet making use of the awesome stuff it can do with creating local accounts out of your user's directory account credentials - sorry Joel! On the flip side of that, NoMAD Login is modular - and you have the flexibility to use whichever parts or mechs you want.

## Ingredients for login-less provisioning

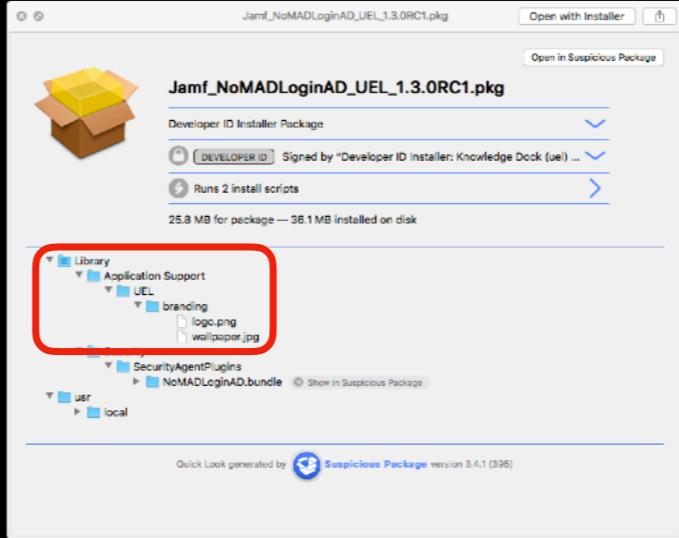

Now - I want to achieve a provisioning workflow where the provisioner doesn't need to log in - they'll just need to go through the Setup Assistant then input the name and role (or not if we're re-provisioning a Mac against its previous name and role)...

# Ingredients for login-less provisioning

We'll need an installer package that contains NoMAD Login. It has to be signed with a developer ID certificate because of how we'll be deploying it with Jamf - other MDMs might need this too. You need access to an Apple developer account to get that certificate.

# Ingredients for login-less provisioning

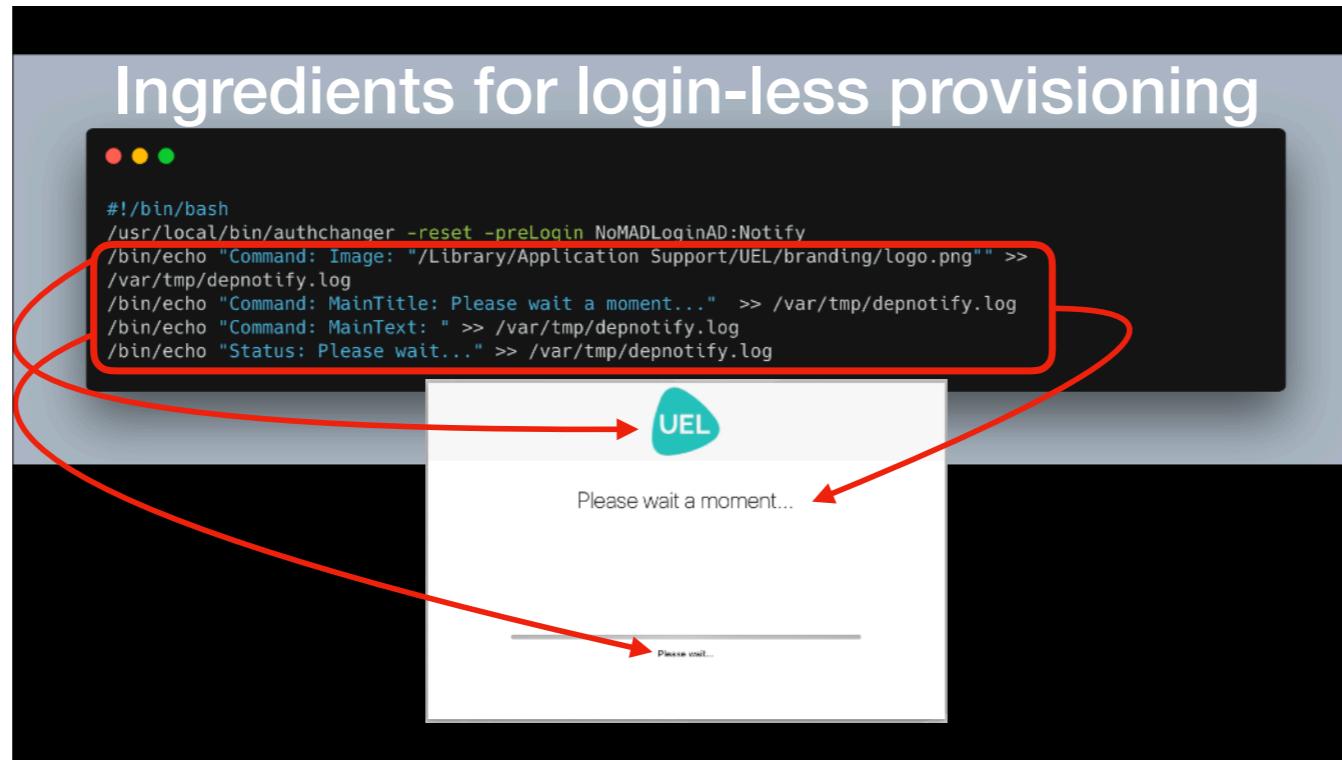

I took the package provided on the NoMAD Login gitlab repo and re-packaged it, to include our branding; a logo and wallpaper

## Ingredients for login-less provisioning

```
#!/bin/bash
/usr/local/bin/authchanger -reset -preLogin NoMADLoginAD:Notify
/bin/echo "Command: image: /Library/Application Support/UEI/branding/logo.png" >>
/var/tmp/deponotify.log
/bin/echo "Command: MainTitle: Please wait a moment..." >> /var/tmp/deponotify.log
/bin/echo "Command: MainText: " >> /var/tmp/deponotify.log
/bin/echo "Status: Please wait..." >> /var/tmp/deponotify.log
```

I tweaked the postinstall script. We run authchanger, which a great tool that comes with NoMAD Login that makes changes to the authorisation database safely. We get it to swap out Apple's login window for just NoMAD Login's Notify mech.

## Ingredients for login-less provisioning

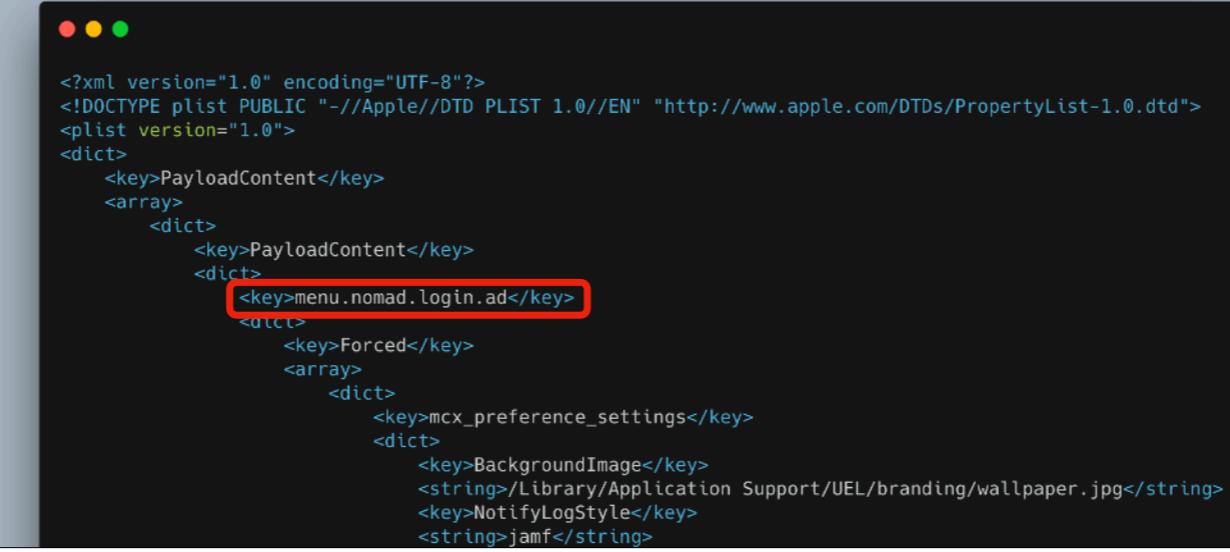

And echo the commands we needed to make the Notify mech show our logo, along with title and status text asking the provisioner to wait. If you've used DEPNotify - you'll see that those commands are exactly the same - since NoMAD Login's Notify part is DEPNotify.

# Ingredients for login-less provisioning

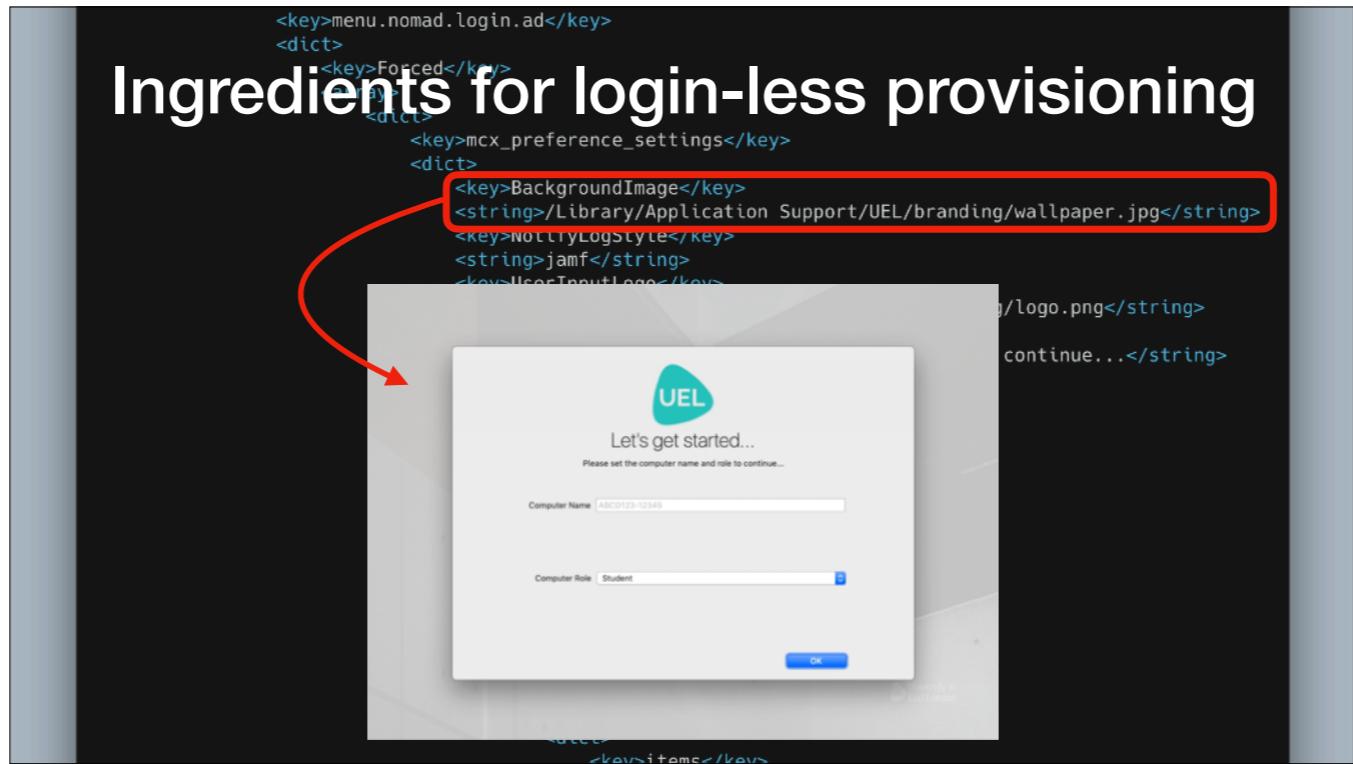

Next up, we need a configuration profile

# Ingredients for login-less provisioning

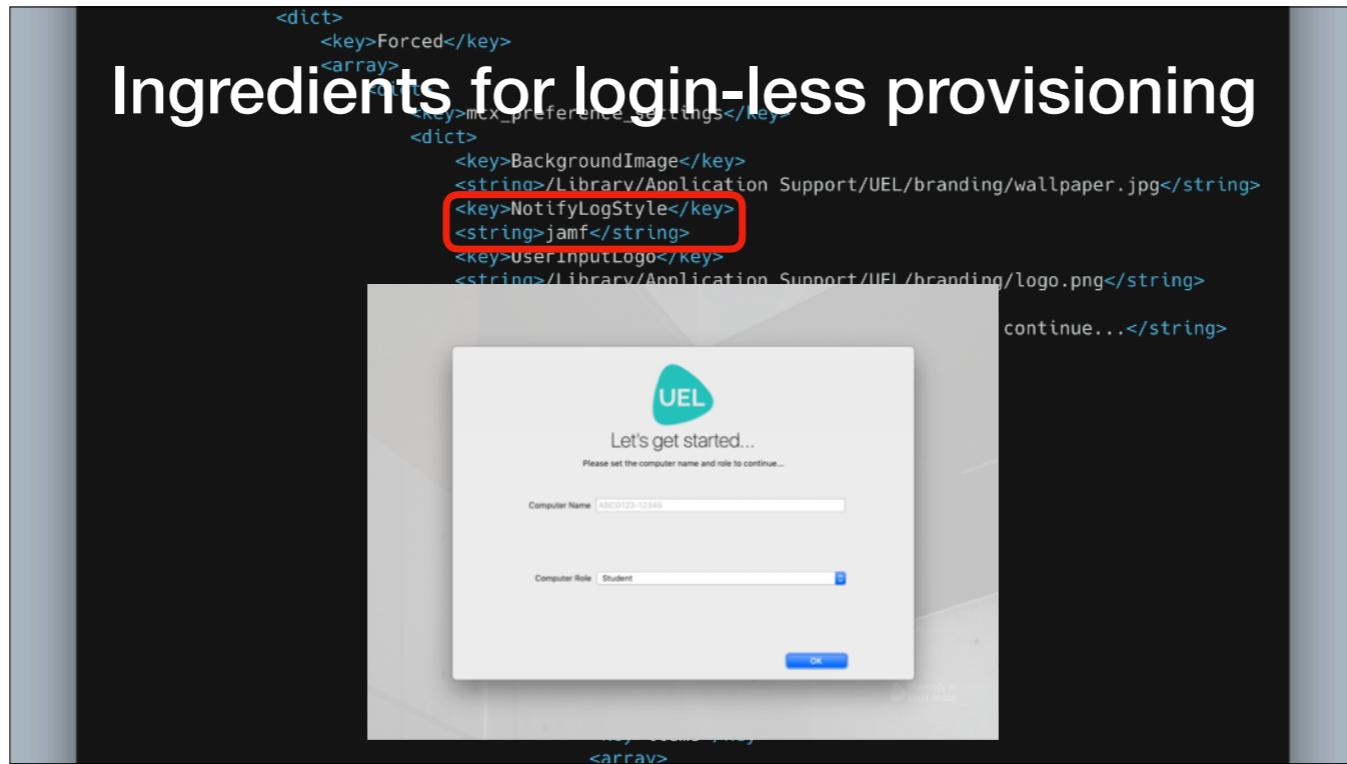

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
    <key>PayloadContent</key>
    <array>
        <dict>
            <key>PayloadContent</key>
            <dict>
                <key>menu.nomad.login.ad</key> (highlighted)
                <dict>
                    <key>Forced</key>
                    <array>
                        <dict>
                            <key>mcx_preference_settings</key>
                            <dict>
                                <key>BackgroundImage</key>
                                <string>/Library/Application Support/UEL/branding/wallpaper.jpg</string>
                                <key>NotifyLogStyle</key>
                                <string>jamf</string>
                            
```

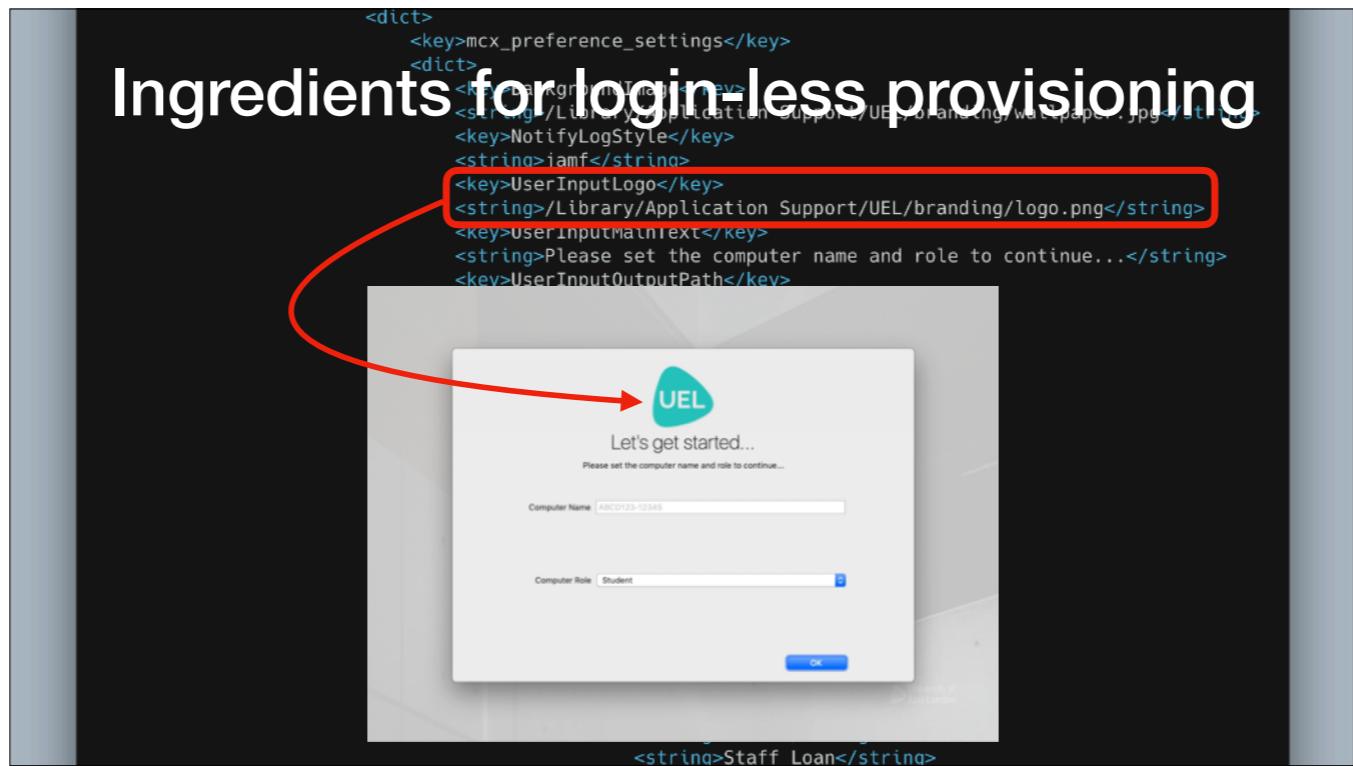

We're managing the menu.nomad.login.ad domain

We set NoMAD Login's background image to the one we installed with our package

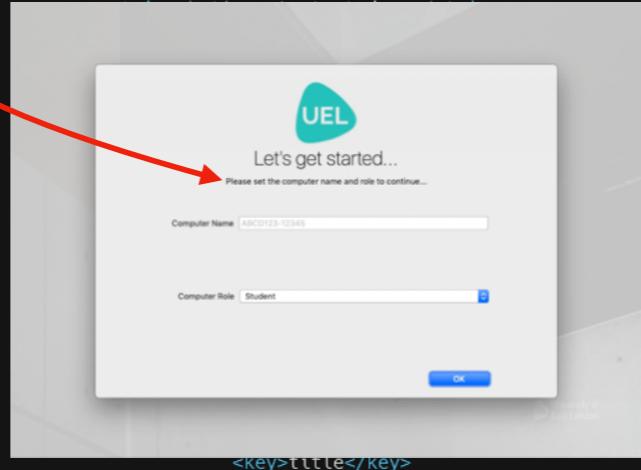

We tell the Notify part of NoMAD login to parse the Jamf log, so that the status text will update to show package installs done by policies. This supports other management tools including munki.

Now we come to the settings we need for NoMAD Login's User Input screen. This is separated out from the Notify screen, as you'll see soon, but we need to set up a few things before we use it. First of all, we'll tell it to use our branding logo.

# Ingredients for login-less provisioning

```
<key>BackgroundImage</key>
<string>/Library/Application Support/UEL/branding/wallpaper.jpg</string>
<key>NotificationStyle</key>
<string>jamf /title</string>
<key>UserInputLog</key>
<string>/Library/Application Support/UEL/branding/logo.png</string>
<key>UserInputMainText</key>
<string>Please set the computer name and role to continue...</string>
<key>UserInputOutputPath</key>
<string>/var/tmp/userinputoutput.txt</string>
<key>UserInputTitle</key>
```

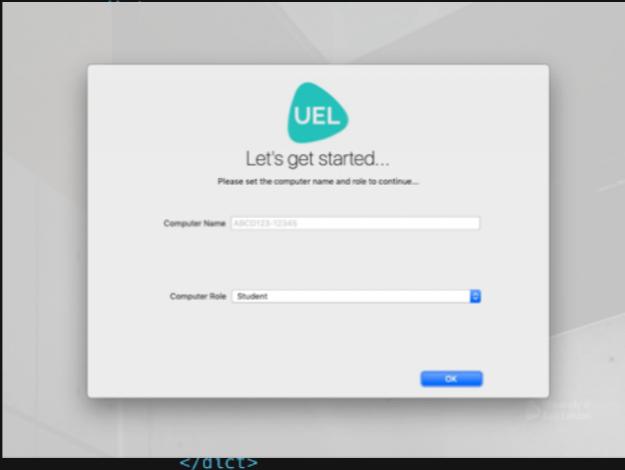

<key>title</key>

Then a block of main text - in this case we're providing some instructions to the person provisioning the Mac.

# Ingredients for login-less provisioning

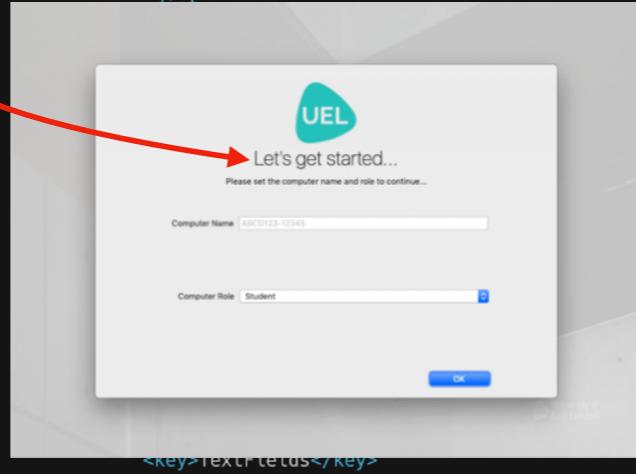

```
<key>NotifyLogStyle</key>
<string>jamf</string>
<key>UserInputLogo</key>
<string>/Library/Application Support/UEL/LoadingLogo.png</string>
<key>UserInputLabelText</key>
<string>Please set the computer name and role to continue...</string>
<key>UserInputOutputPath</key>
<string>/var/tmp/userinputoutput.txt</string>
<key>UserInputTitle</key>
<string>Let's get started...</string>
<key>UserInputUI</key>
```

We tell User Input where it's going to store the information our provisioner provides - this will be an XML property list.

# Ingredients for login-less provisioning

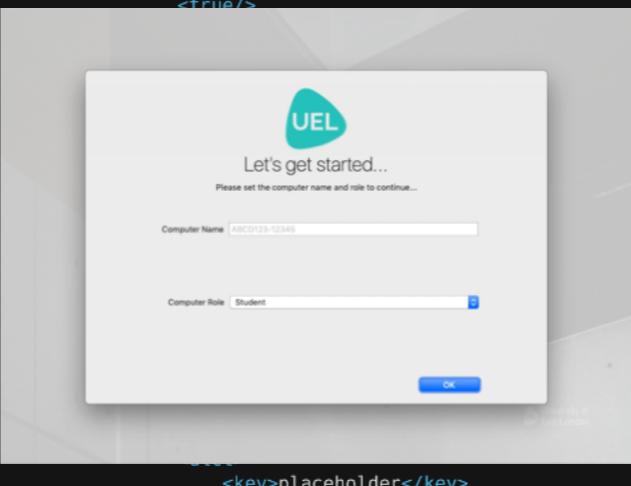

```
<key>UserInputLogo</key>
<string>/Library/Application Support/UEL/branding/logo.png</string>
<key>UserInputMainTxt</key>
<string>Please enter the computer name and role to continue...</string>
<key>UserInputOutputPath</key>
<string>/var/tmp/userinputoutput.txt</string>
<key>UserInputTitle</key>
<string>Let's get started...</string>
<key>UserInputUI</key>
<dict>
    <key>Button</key>
        <string>OK</string>
</dict>
```

We give the User Input window a nice friendly title

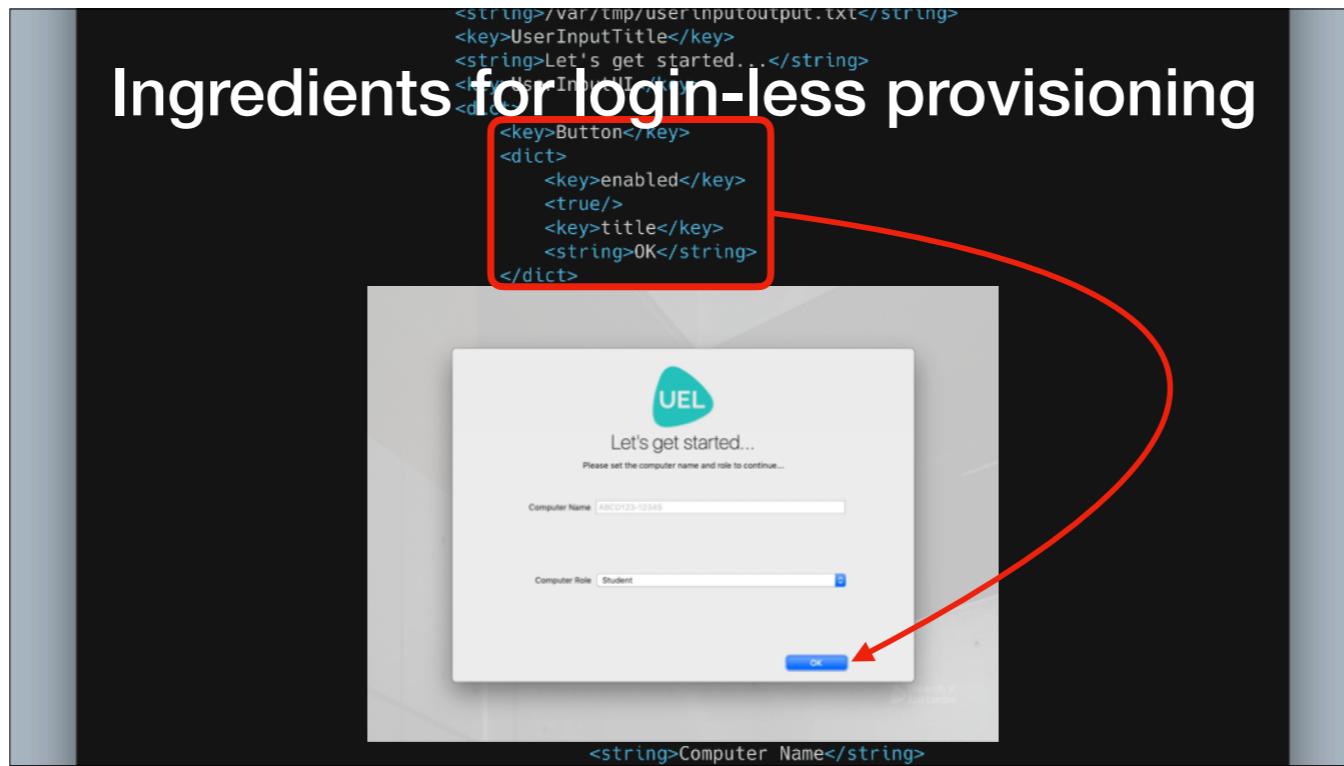

# Ingredients for login-less provisioning

```
<key>UserInputMainText</key>
<string>Please set the computer name and role to continue...</string>
<key>UserInputOutputPath</key>
<string>/var/Disk/Output/UserInput/</string>
<key>UserInputTitle</key>
<string>Let's get started...</string>
<key>UserInputUI</key>
<dict>
    <key>button</key>
    <dict>
        <key>enabled</key>
        <true/>
    </dict>
    <key>placeholder</key>
```

And then we need to define the different user interface elements we'll need. This is all done under the UserInputUI preference but it's fairly complicated because each group of elements is defined as a nested dictionary. I'll make this profile available so you can use it as a template. But also keep an eye on a tool called Profile Creator from Erik Berglund. It has a manifest for NoMAD Login which will be updated to have these new preferences, if it hasn't been already.

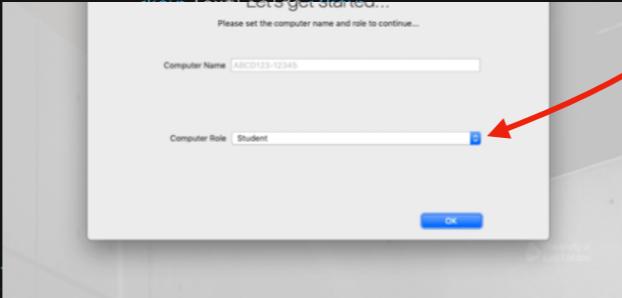

# Ingredients for login-less provisioning

So, we want an OK button to click after we've entered all the information.

# Ingredients for login-less provisioning

```
<key>enabled</key>
<true/>
<key>title</key>
<string>Let's get started...</string>
<key>PopUps</key>
<array>
<dict>
<key>items</key>
<array>
<string>Student</string>
<string>Staff</string>
<string>Staff Loan</string>
</array>
<key>title</key>
<string>Computer Role</string>
</dict>
</array>
```

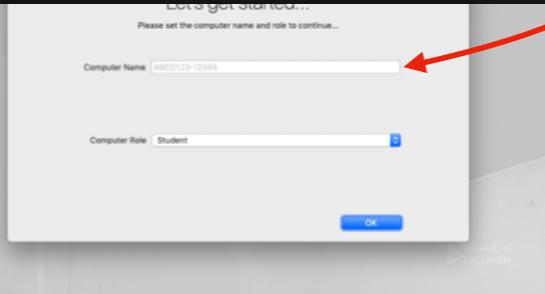

```
</ar
</dict>
```

We need one drop-down menu which we'll call Computer Role - it'll have 3 choices; Student, Staff and Staff Loan.

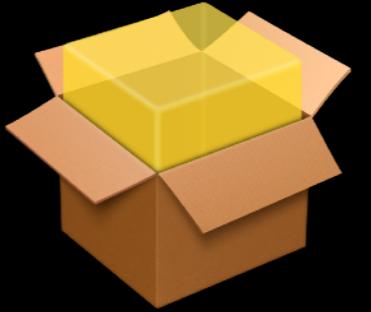

# Ingredients for login-less provisioning

```
</array>
<key>title</key>
<string>Computer Role</string>
</dict>
<array>
<key>TextFields</key>
<array>
<dict>
<key>placeholder</key>
<string>ABCD123-12345</string>
<key>title</key>
<string>Computer Name</string>
</dict>
</array>
</dict>
</array>
</dict>
<key>Payload</key>
<string></st</string>
<key>Payload</key>
<string>Cust</string>
<key>Payload</key>
<true/>
<key>Payload</key>
<string>36EC</string>
<key>Payload</key>
<string>Univ</string>
<key>Payload</key>
<string>com.apple.ManagedClient.preferences</string>
```

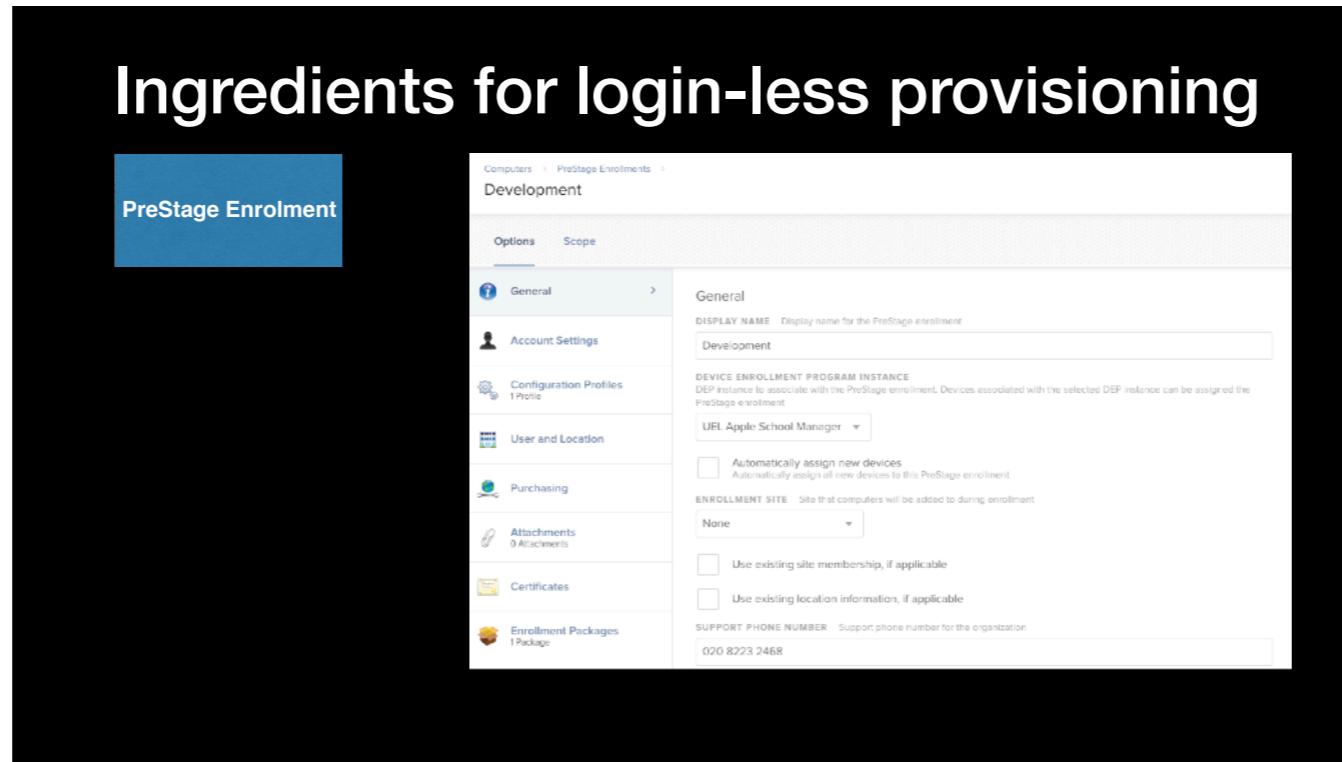

And we need one Text Field, called Computer Name, with some placeholder text just to remind the provisioner of our naming convention.

## Ingredients for login-less provisioning

So we have our signed package with NoMAD Login plus our branding and postinstall script. We have a profile to set all the preferences we need. Let's get them into our MDM solution - in my case that's Jamf. So the rest of what I'm going to talk about will focus on Jamf as the management tool. But remember, the concepts can be achieved with other tools.

# Ingredients for login-less provisioning

The screenshot shows the Jamf Pro interface for setting up a PreStage Enrollment. The left side has a sidebar with options like General, Account Settings, Configuration Profiles, User and Location, Purchasing, Attachments, Certificates, and Enrollment Packages. The main area is titled 'Development' under 'General'. It includes fields for 'DISPLAY NAME' (Development), 'DEVICE ENROLLMENT PROGRAM INSTANCE' (set to Apple School Manager), 'ENROLLMENT SITE' (set to None), and checkboxes for 'Automatically assign new devices', 'Use existing site membership, if applicable', and 'Use existing location information, if applicable'. There's also a 'SUPPORT PHONE NUMBER' field with the value '020 8223 2468'.

We need a PreStage Enrollment - to determine what's going to happen when you hit that DEP Remote Management screen in the Setup Assistant. And if you're running the current version of Jamf, you'll see some new options to add Configuration Profiles and packages so that they're guaranteed to be installed before the Setup Assistant finishes.

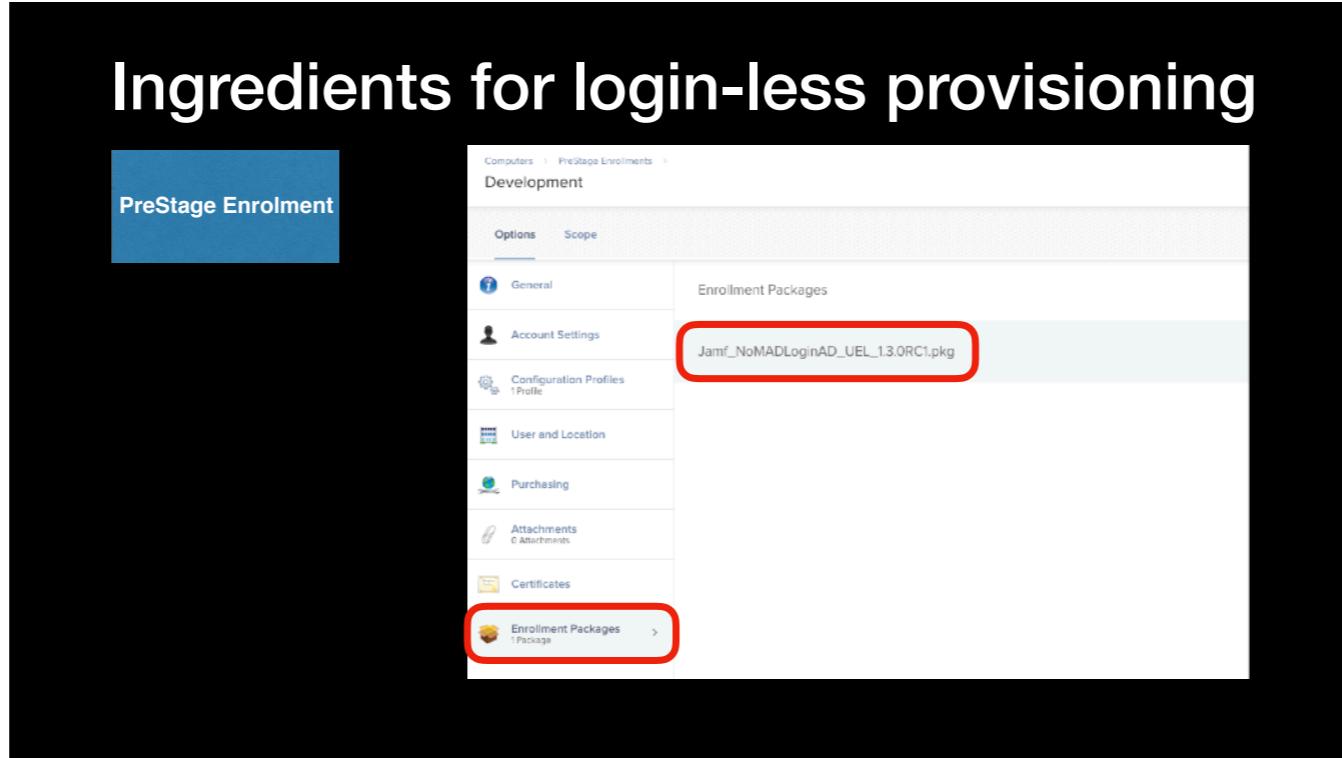

# Ingredients for login-less provisioning

The screenshot shows the 'PreStage Enrollment' configuration profile in the Jamf Pro interface. The left sidebar lists various settings like General, Account Settings, Configuration Profiles, User and Location, Purchasing, Attachments, Certificates, and Enrollment Packages. The 'Configuration Profiles' item is highlighted with a red box. The main pane displays a list of configuration profiles with their names, descriptions, and scopes. One profile, 'Jamf NOMAD Login AD - Defaults', is selected and highlighted with a red box. Its scope is listed as 'Provisioning - DEP Development'.

| Name                                   | Description                           | Scope   |
|--|---------------------------------------|---|
| Bonix iStopMotion 3 - Defaults         |                                       | Has_Bonix_iStopMotion                           |
| Figure53 QLab 4 - Defaults             |                                       | Has_Figure53_QLab_4                             |
| FileMaker Pro - Defaults               |                                       | Has_FileMaker_Pro                               |
| Frederik Berlaen DrawBot - Defaults    |                                       | Has_Frederik_Berlaen_DrawBot                    |
| Georg Seifert Glyphs - Defaults        |                                       | Has_Georg_Seifert_Glyphs                        |
| Google Chrome - Defaults - Staff       |                                       | Has_Google_Chrome_Staff                         |
| Google Chrome - Defaults - Students    |                                       | Has_Google_Chrome_Students                      |
| Hasselblad Phocus - Defaults           |                                       | Has_Hasselblad_Phocus                           |
| Iterate Cyberduck - Defaults           |                                       | Has_Iterate_Cyberduck                           |
| <b>Jamf NOMAD Login AD - Defaults</b>  | <b>Provisioning - DEP Development</b> |   |
| MacPaw The Unarchiver - Defaults       |                                       | Has_MacPaw_The_Unarchiver                       |
| Microsoft AutoUpdate - Development     |                                       | Test Macs                                       |
| Microsoft AutoUpdate - Live            |                                       | All Managed Clients, 4 computer groups excluded |
| Microsoft AutoUpdate - Pilot           |                                       | 3 computer groups, Test Macs excluded           |
| Microsoft Office - Defaults            |                                       | All Managed Clients                             |
| Microsoft OneDrive Updater - Defaults  |                                       | No scope defined                                |
| Microsoft Remote Diskcovery - Defaults |                                       | Has_Microsoft_Remote_Diskcovery                 |

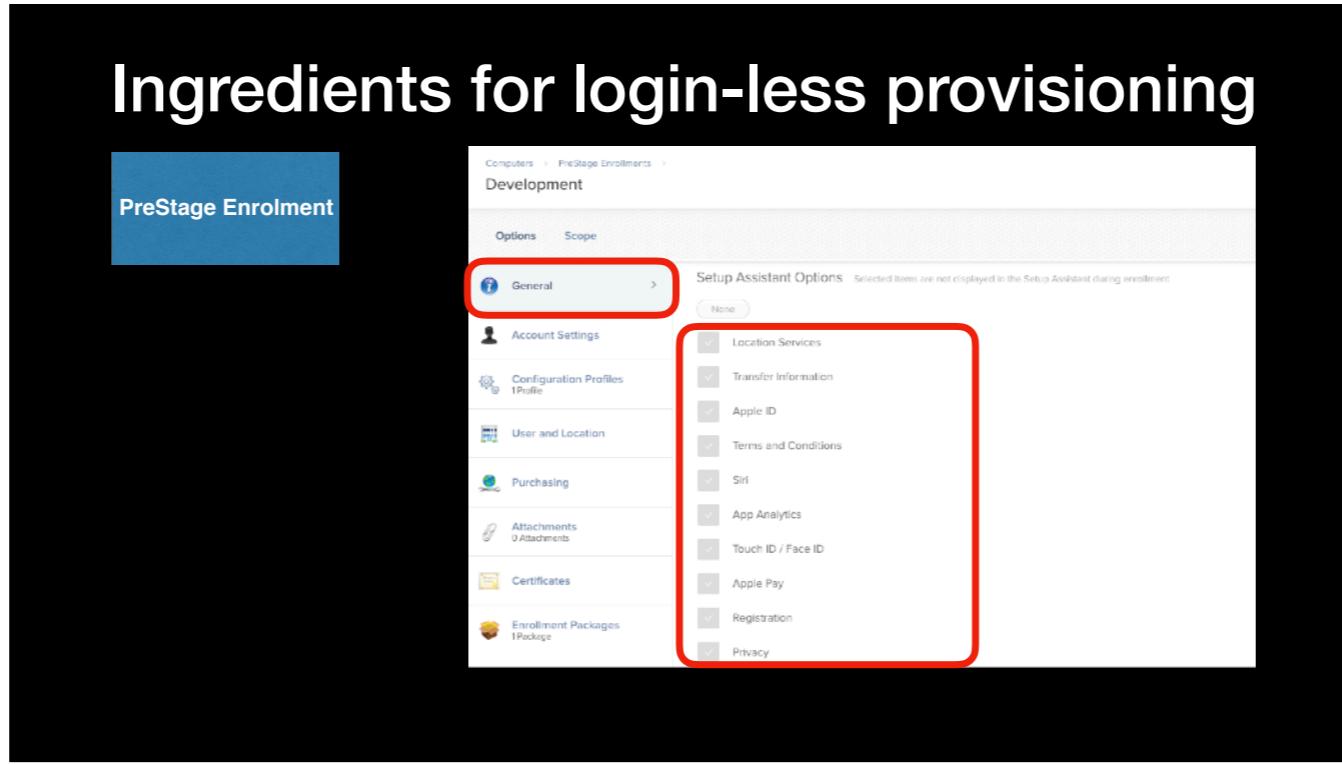

Add our Configuration Profile.

# Ingredients for login-less provisioning

And our signed package to the Enrollment Packages payload. It'll be delivered by an MDM command so that's why it has to be signed - because Apple said so.

# Ingredients for login-less provisioning

We want to skip as many parts of the Setup Assistant as we can.

# Ingredients for login-less provisioning

The screenshot shows the 'PreStage Enrollment' interface. On the left, a sidebar lists options: General, Account Settings (highlighted with a red box), Configuration Profiles, User and Location, Purchasing, Attachments, Certificates, and Enrollment Packages. The main panel is titled 'Development' and shows a 'Management Account' configuration. It includes fields for 'ACCOUNT USERNAME' (jssadmin) and a section to 'Create an additional local administrator account'. This section contains fields for 'USERNAME' (ladmin), 'PASSWORD', 'VERIFY PASSWORD', and a checked 'Hide Account' checkbox. Below this, under 'Local User Account Type', there are three radio button options: 'Administrator Account' (selected), 'Standard Account', and 'Skip Account Creation'. A red box highlights the 'Create an additional local administrator account' section.

And have a hidden local administrator

# Ingredients for login-less provisioning

The screenshot shows the 'PreStage Enrollment' interface. On the left, there's a sidebar with options like General, Account Settings (which is highlighted with a red box), Configuration Profiles, User and Location, Purchasing, Attachments, Certificates, and Enrollment Packages. The main area is titled 'Development' and shows 'Management Account' settings. It includes fields for 'ACCOUNT USERNAME' (jssadm) and 'CREATE AN ADDITIONAL LOCAL ADMINISTRATOR ACCOUNT' (checkbox checked, with fields for 'USERNAME' (ladmin), 'PASSWORD', and 'VERIFY PASSWORD'). There's also a 'Hide Account' checkbox. At the bottom, there's a section titled 'Local User Account Type' with three radio button options: 'Administrator Account' (radio button checked), 'Standard Account', and 'Skip Account Creation'. The 'Skip Account Creation' option is also highlighted with a red box.

But most importantly, skip the part where the Setup Assistant asks you to create the first local user.

# Ingredients for login-less provisioning

The screenshot shows the Jamf Pro interface for creating a Smart Group. On the left, there are two cards: "PreStage Enrolment" and "Smart Group". The "Smart Group" card is selected. On the right, the "Provisioning - DEP Development" screen is displayed, showing the criteria for the Smart Group. A red box highlights the first criterion in the table:

| AND/OR | CRITERIA                                  | OPERATOR | VALUE       |
|--------|---|----------|-------------|
|        | Enrollment Method:<br>PreStage enrollment | IS       | Development |

Next up, we'll want a Smart Group for all the Macs we assign to our PreStage Enrollment... Jamf has a criteria called Enrollment Method that we can use, which makes it pretty easy.

# Ingredients for login-less provisioning

The diagram illustrates the three key ingredients for login-less provisioning:

- PreStage Enrolment
- Smart Group
- Extension Attributes

The 'Extension Attributes' component is expanded to show its configuration in the Jamf Pro interface. The 'Mac User Role' extension attribute is selected, with its settings displayed:

- DISPLAY NAME:** Mac User Role
- DESCRIPTION:** Description for the extension attribute
- DATA TYPE:** String (highlighted with a red box)
- INVENTORY DISPLAY:** General
- INPUT TYPE:** Text Field (highlighted with a red box)
- RECON DISPLAY:** Computer

We need 2 Extension Attributes; one for each Mac's hostname and the other for its role. These should have a data type of string and an input type of text field.

# Ingredients for login-less provisioning

The image consists of two main parts. On the left, there is a vertical stack of four blue rectangular boxes, each containing white text: "PreStage Enrolment", "Smart Group", "Extension Attributes", and "Policy". On the right, there is a screenshot of a computer screen displaying the Jamf Pro interface. The title bar says "Computers > Policies > DEP - 10 - Provision Development". Below the title are tabs for "Options", "Scope", "Self Service", and "User Interaction", with "User Interaction" being the active tab. Under "User Interaction", there is a "Trigger" section with a list of events. One event, "Enrollment Complete", is checked and highlighted with a red oval. Other events listed include "Startup", "Login", "Logout", "Network State Change", "Recurring Check-in", and "Custom".

And finally, we want a policy to run as soon as the Mac is enrolled and the Jamf binary is installed.

# Ingredients for login-less provisioning

The screenshot shows the Jamf Pro interface for configuring a policy. On the left, there's a sidebar with four items: PreStage Enrollment, Smart Group, Extension Attributes, and Policy. The Policy item is highlighted. The main area is titled "DEP - 10 - Provision Development". It has tabs for Options, Scope, Self Service, and User Interaction, with "Options" selected. Under "Trigger", there's a section for "Events to use to initiate the policy". A red box highlights the "Scripts" section, which contains a single item: "1Script". Other trigger options shown include Startup, Login, Logout, Network State Change, Enrollment Complete (which is checked), Recurring Check-in, and Custom.

All this policy will do is run one script - which I'll come to in a minute.

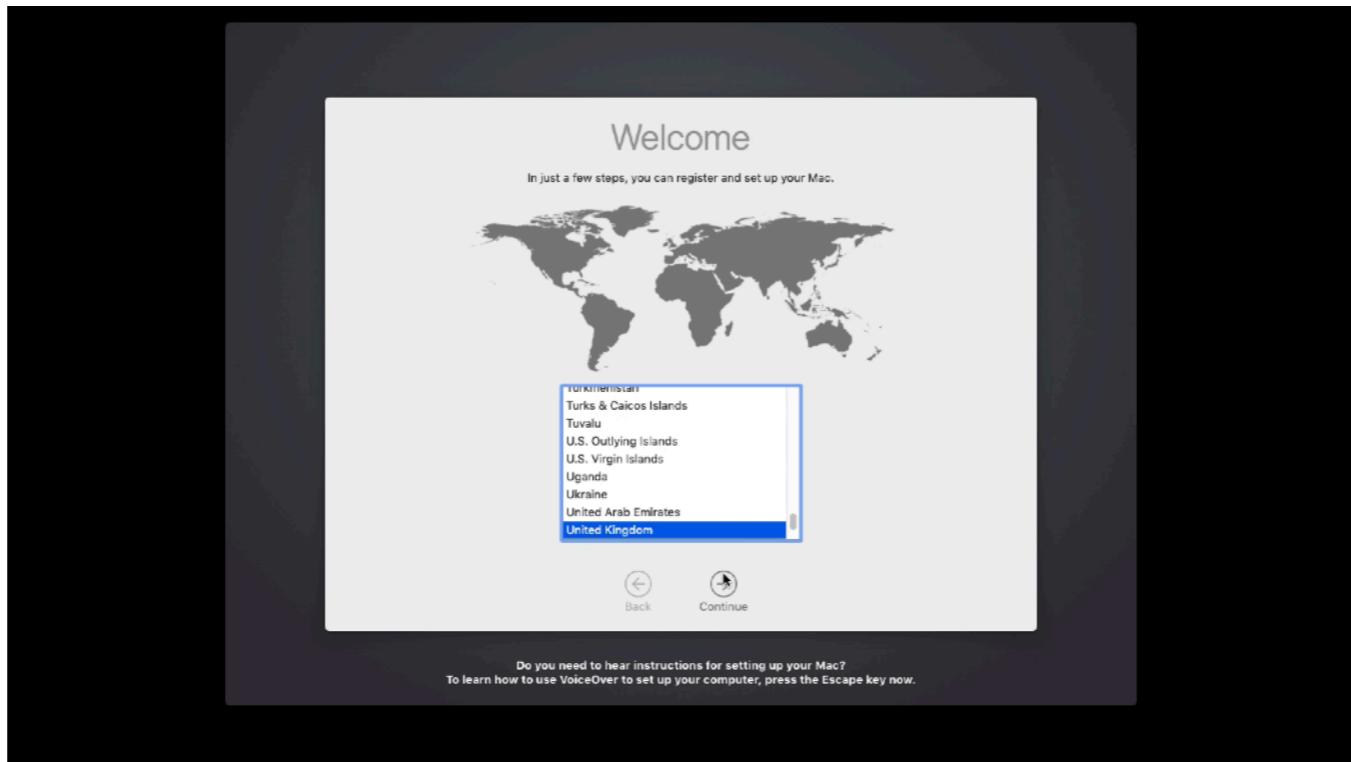

# Ingredients for login-less provisioning

The screenshot shows the Jamf Pro interface for configuring a policy. On the left, there is a vertical sidebar with four items: PreStage Enrolment, Smart Group, Extension Attributes, and Policy. The Policy item is highlighted. To the right, the main window displays the 'DEP - 10 - Provision Development' policy configuration. The 'Scope' tab is selected. The 'Targets' section shows the target computer and user settings. A red box highlights the 'TARGET' row, which lists 'Provisioning - DEP Development' under 'TARGET' and 'Smart Computer Group' under 'TYPE'.

And we scope it so that it'll run on any Mac in the smart group we created before, so that's any Mac that's assigned to our new PreStage Enrolment.

What happens?

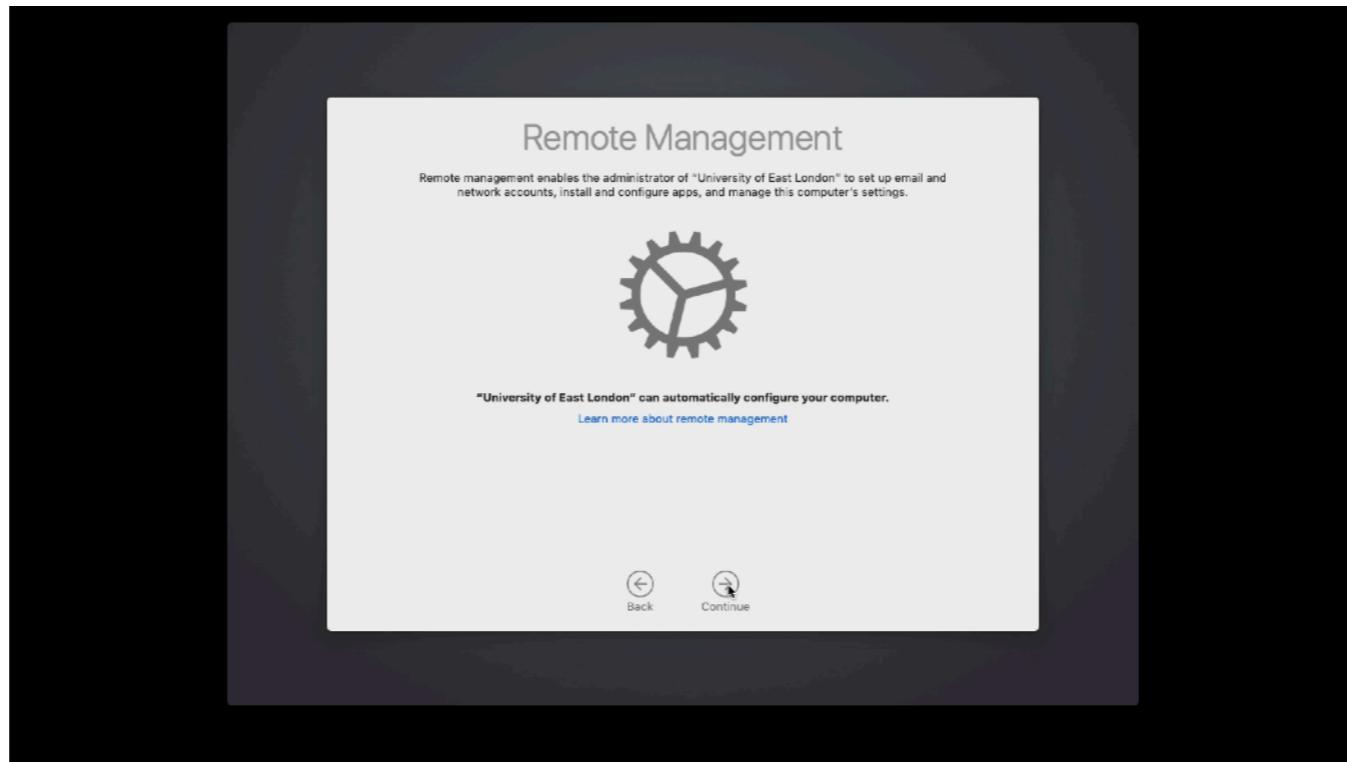

You've installed macOS and we're at the Setup Assistant

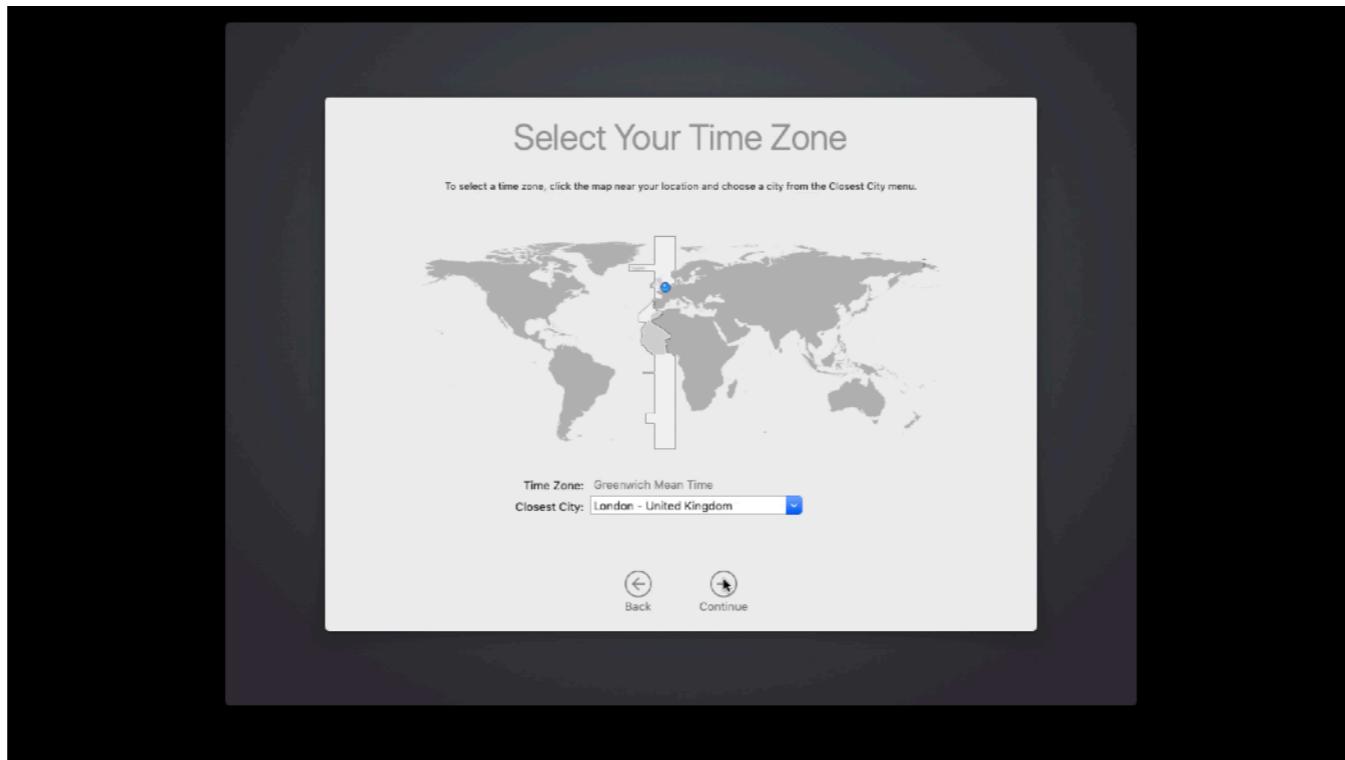

Choose your country

And your keyboard layout

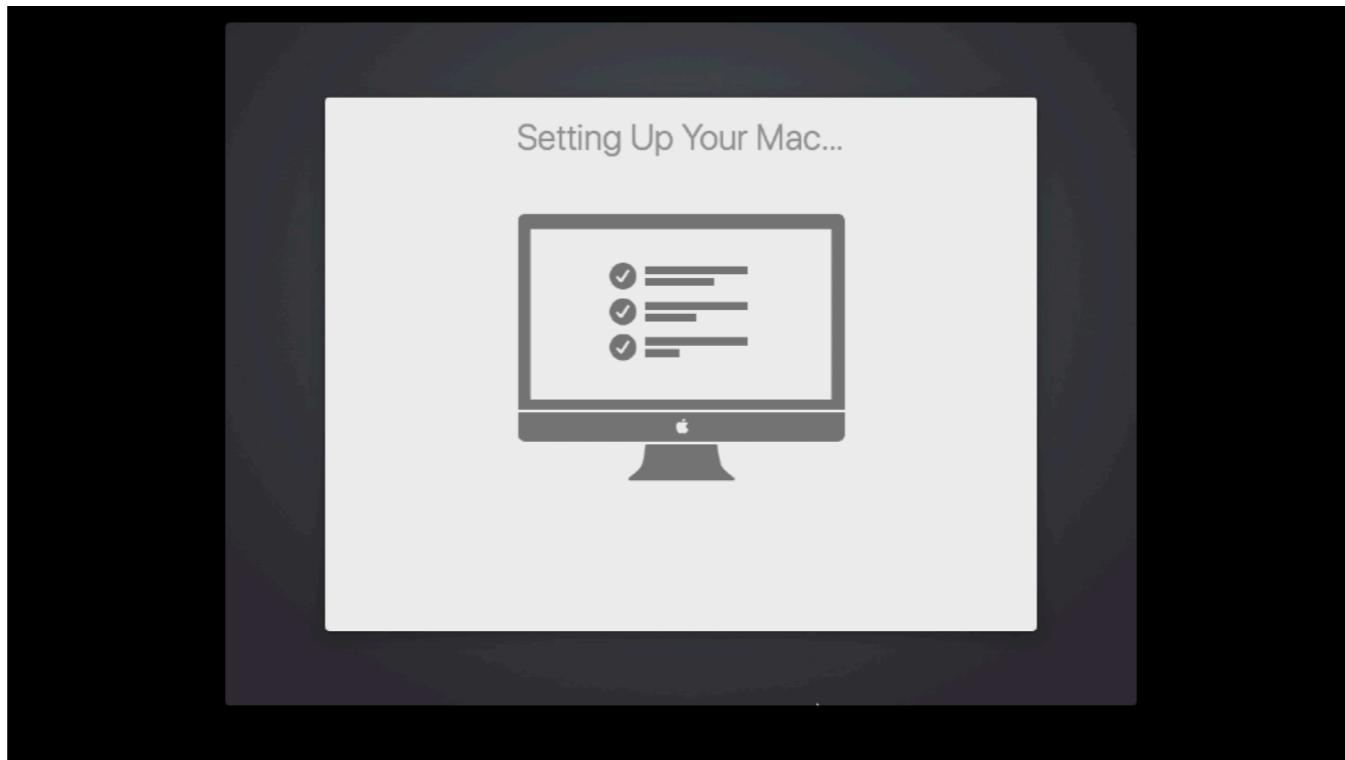

We hit the Remote Management screen because our Mac is assigned to Apple School Manager and our PreStage in Jamf.

Now at this point, some things start to happen in the background. Our Mac enrolls into the MDM part of Jamf.

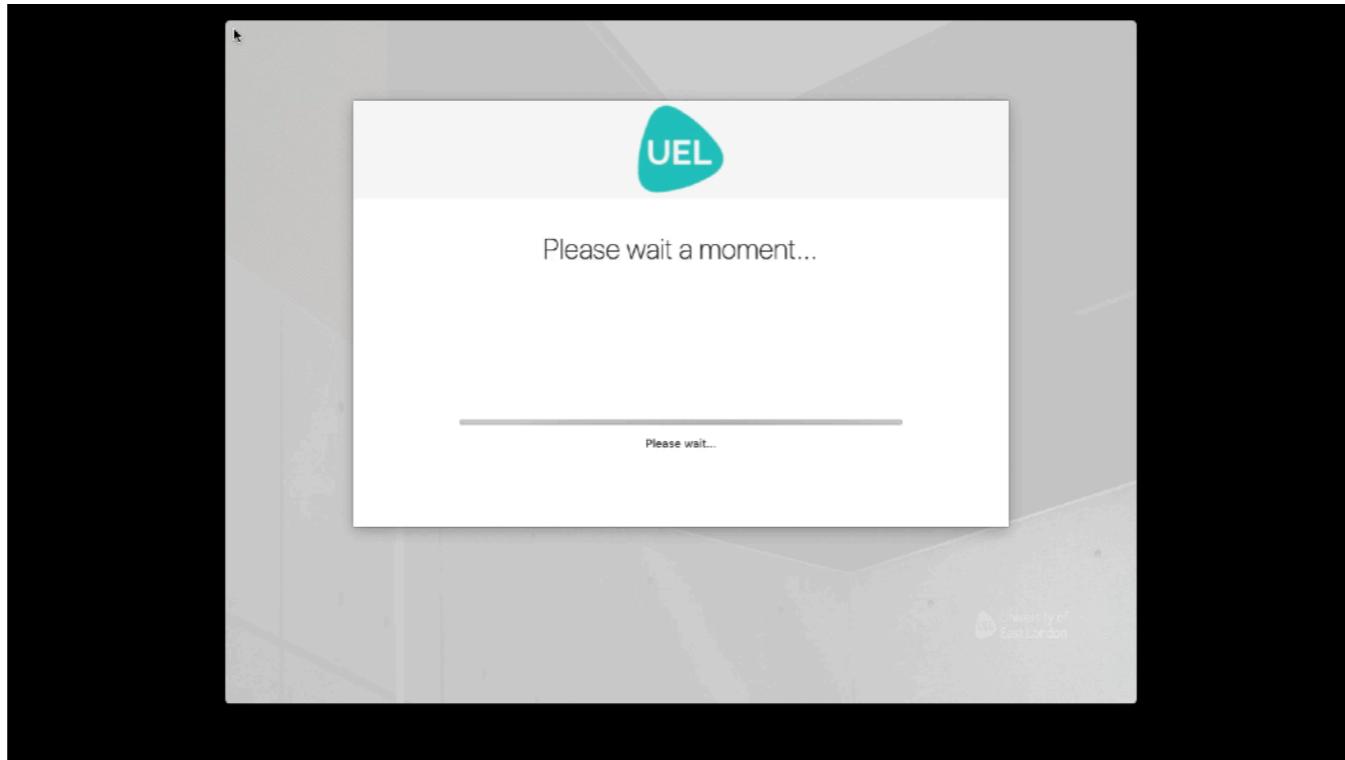

Along with the Jamf binary and framework, our package with NoMAD Login and the configuration profile we defined in our Prestage are delivered now. The important thing to remember is that the Setup Assistant won't finish until that package and profile are installed.

The Setup Assistant finishes... and remember, our package's postinstall script has done its thing and used authchanger to have the Notify part of NoMAD Login replace Apple's login window...

Drumroll please....

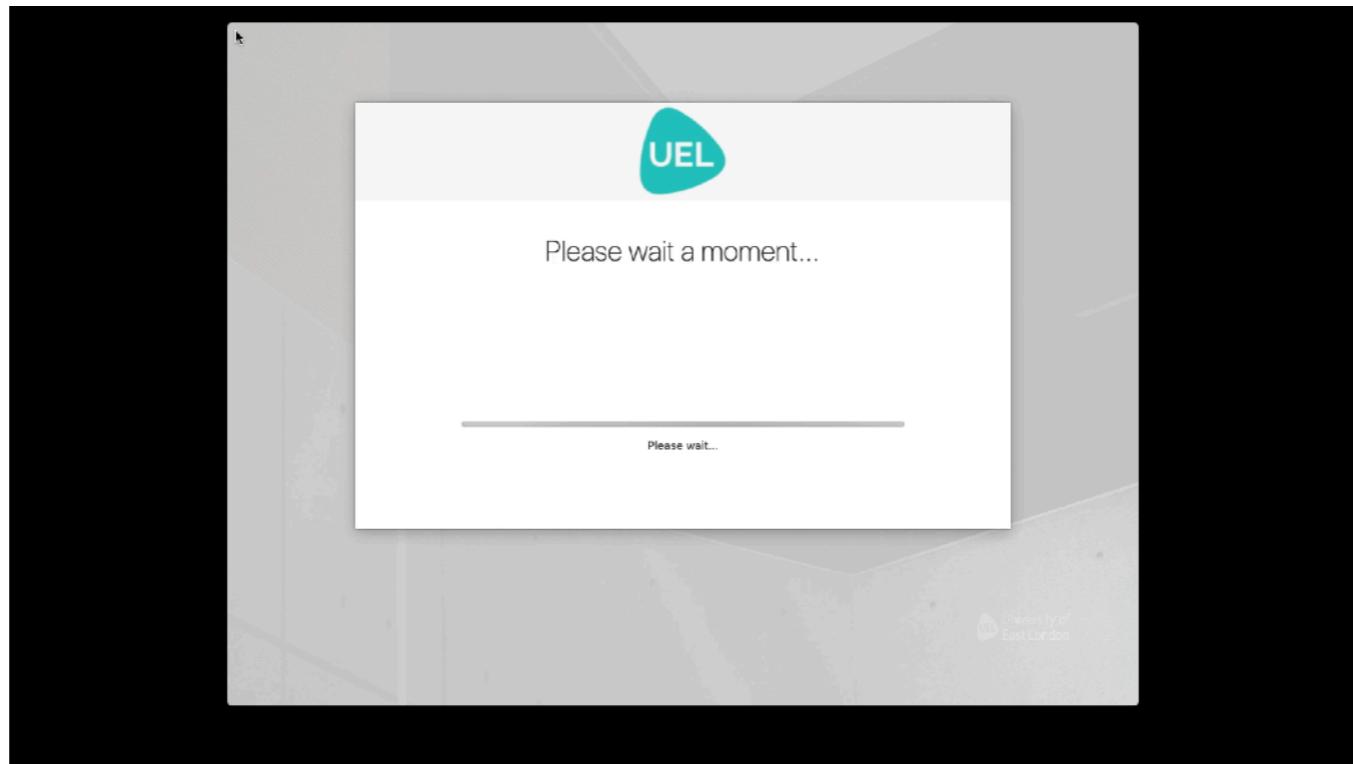

And this is what we see! Now, it's up to us to drive the journey forward.

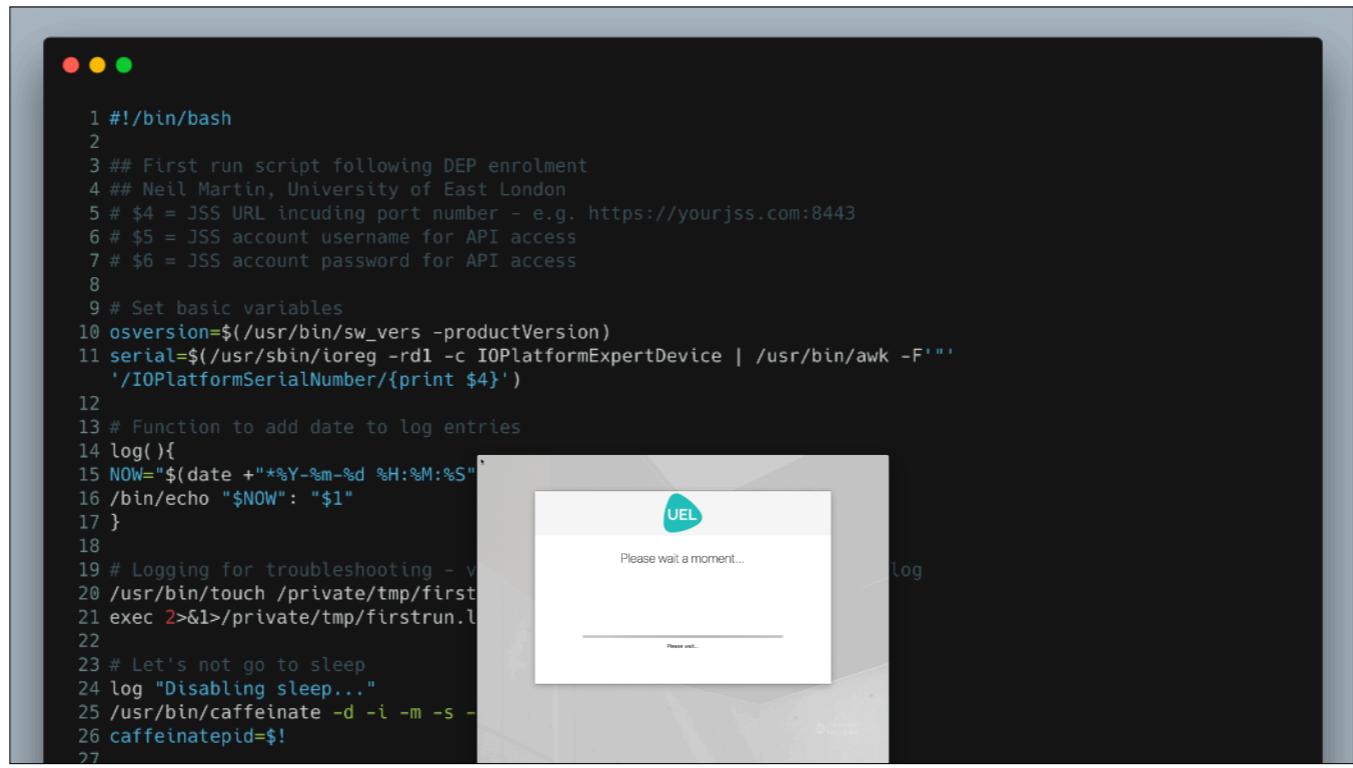

In my case, Jamf will execute a policy with its enrolmentcomplete trigger and that policy will run a script that will do the rest.

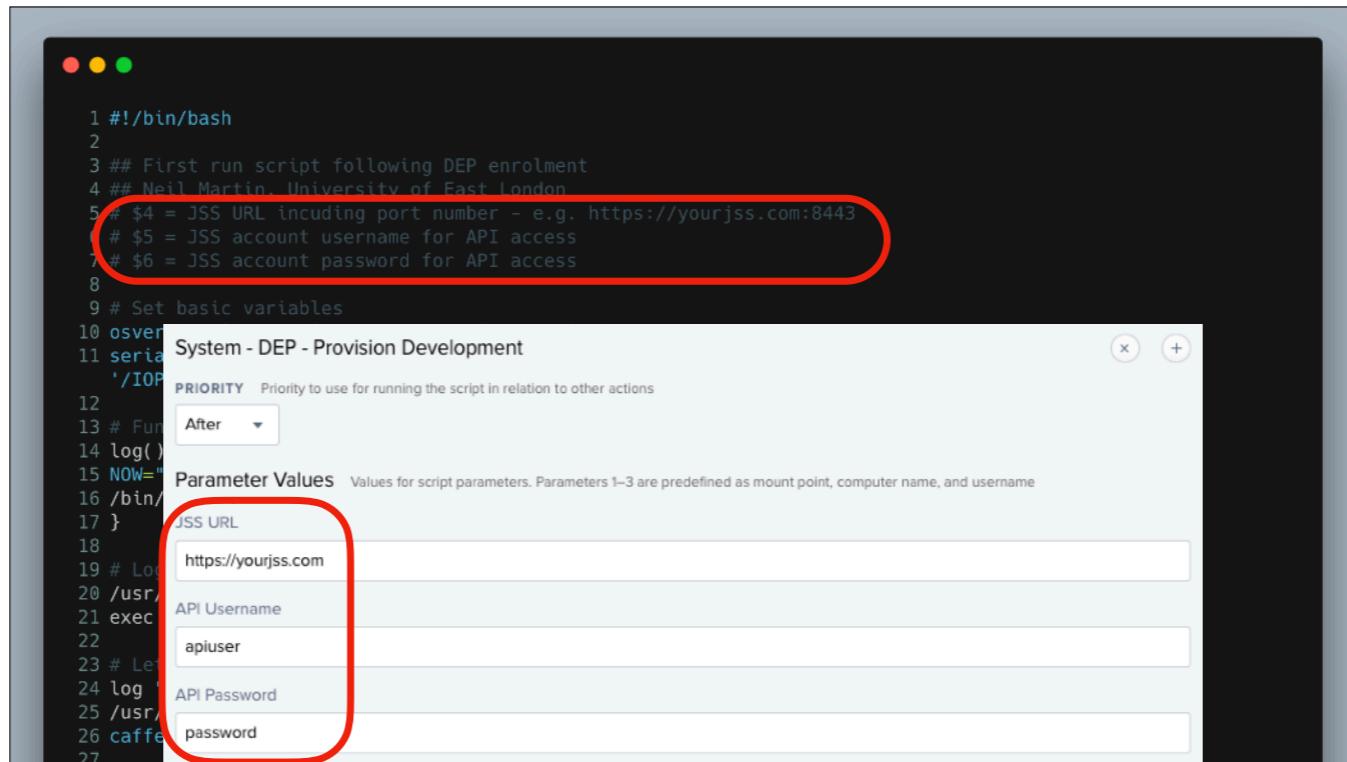

I'll also mention that NoMAD Login has a run script mechanism so it can execute your provisioning script and drive the process instead.

It's time for some Bash! We all love a bit of Bash, right? Thank you to the wonderful Steve Quirke for this picture!

First things first, we will be using a little bit of the Jamf API so the script will need to send credentials to our Jamf Server for the account we're using to access it. Security is important, so, instead of storing these in the script in plain text, we'll add them as parameters in the policy that executes the script itself. Parameter 4 is the JSS URL, 5 is the username of the API account and 6 is its password.

```
 2
 3 ## First run script following DEP enrolment
 4 ## Neil Martin, University of East London
 5 # $4 = JSS URL incuding port number - e.g. https://yourjss.com:8443
 6 # $5 = JSS account username for API access
 7 # $6 = JSS account password for API access
 8
 9 # Get basic variables
10 osversion=$(/usr/bin/sw_vers -productVersion)
11 serial=$(/usr/sbin/ioreg -rd1 -c IOPlatformExpertDevice | /usr/bin/awk -F"'"
11     '/IOPlatformSerialNumber/{print $4}')
12
13 # Function to add date to log entries
14 log(){
15 NOW=$(date +"%Y-%m-%d %H:%M:%S")
16 /bin/echo "$NOW": "$1"
17 }
18
19 # Logging for troubleshooting - view the log at /private/tmp/firstrun.log
20 /usr/bin/touch /private/tmp/firstrun.log
21 exec 2>&1>/private/tmp/firstrun.log
22
23 # Let's not go to sleep
24 log "Disabling sleep..."
25 /usr/bin/caffeinate -d -i -m -s -
26 caffeinatelpid=$!
27
28 # Disable Automatic Software Update
29 log "Disabling automatic software update"
30 /usr/sbin/softwareupdate --schedule
31
32 # Copy our wallpaper over Mojave's
```

Next up, we'll make a couple of variables. We want the version number of macOS that's installed so we can feed it back through NoMAD Login's notify screen. And we want the Mac's serial number because we'll need it when we make API calls later.

```
6 # $5 = JSS account username for API access
7 # $6 = JSS account password for API access
8
9 # Set basic variables
10 osversion=$(/usr/bin/sw_vers -productVersion)
11 serial=$(/usr/sbin/ioreg -rd1 -c IOPlatformExpertDevice | /usr/bin/awk -F'"'
12     '/IOPlatformSerialNumber/{print $4}')
13
14 # Function to add date to log entries
15 log(){
16     NOW=$(date +"%Y-%m-%d %H:%M:%S")
17     /bin/echo "$NOW": "$1"
18 }
19
20 # Logging for troubleshooting - view the log at /private/tmp/firstrun.log
21 /usr/bin/touch /private/tmp/firstrun.log
22 exec 2>&1>/private/tmp/firstrun.log
23
24 # Let's not go to sleep
25 log "Disabling sleep..."
26 /usr/bin/caffeinate -d -i -m -s -
27 caffeine pid=$!
28
29 # Disable Automatic Software Update
30 log "Disabling automatic software update"
31 /usr/sbin/softwareupdate --schedule=never
32
33 # Copy our wallpaper over Mojave's
34 /bin/cp "/Library/Application Support/UEL/UEL-Mojave-Backgrounds/Mojave.heic" ~/Desktop/Pictures/Mojave.heic"
35
36 # Check for existing Hostname entry
37 # with User input mech otherwise
38
```

We'll create a function called `log` - which we'll use to add entries to a log file in case we need to troubleshoot.

```
15 NOW=$(date +"\%Y-\%m-\%d \%H:\%M:\%S")  
16 /bin/echo "$NOW": "$1"  
17 }  
18  
19 # Logging for troubleshooting - view the log at /private/tmp/firstrun.log  
20 /usr/bin/touch /private/tmp/firstrun.log  
21 exec 2>&1>/private/tmp/firstrun.log  
22  
23 # Let's not go to sleep  
24 log "Disabling sleep..."  
25 /usr/bin/caffeinate -d -i -m -s -u &  
26 caffeinatepid=$!  
27  
28 # Disable Automatic Software Updates during provisioning  
29 log "Disabling automatic software updates..."  
30 /usr/sbin/softwareupdate --schedule off  
31  
32 # Copy our wallpaper over Mojave's default  
33 /bin/cp "/Library/Application Support/UEI/branding/wallpaper.jpg" "/Library/Desktop Pictures/Mojave.heic"  
34  
35 # Check for existing Hostname ext  
# with User Input mech, otherwise,  
36 log "Checking for existing Hostna  
37 e/xml=$(curl "$4"/JSSRes  
"5":"$6" -H "Accept: text/xml")  
38 computerName=$(echo "$e/xml"  
-F'<value>|</value>' '{print $2}'  
39 computerRole=$(echo "$e/xml"  
/usr/bin/awk -F'<value>|</value>'  
40  
41 # Wait for the setup assistant to  
42 log "Waiting for Setup Assistant"
```

The screenshot shows a Mac OS X setup assistant window titled 'UEI'. The window has a light gray background and a white header bar with the title. Below the title, there is a progress bar and the text 'Please wait a moment...'. To the right of the window, there is some terminal output in a dark gray background. The output includes several log messages and command-line entries related to system configuration and software updates.

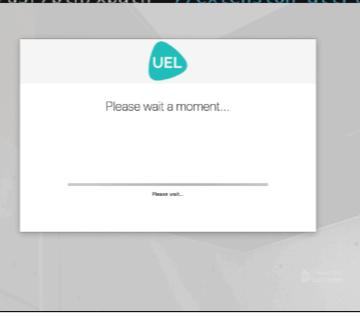

We don't want the Mac to sleep, so we deal with that.

```
20 /usr/bin/touch /private/tmp/firstrun.log
21 exec 2>&1>/private/tmp/firstrun.log
22
23 # Let's not go to sleep
24 log "Disabling sleep..."

# with User Input mech, otherwise, we will proceed with Notify mech only!
36 log "Checking for existing Hostname and Role in JSS..."
37 e/xml=$(curl "$JSSResource/computers/serialnumber/$serial/subset/extension_attributes -u
#"$5":"$6" -H "Accept: text/xml")
38 computerName=$(echo "$e/xml" | xpath '//extension_attribute[name="Hostname"]' | awk
-F'<value>|</value>' '{print $2}')
39 computerRole=$(echo "$e/xml" | xpath '//extension_attribute[name="Mac User Role"]' |
/usr/bin/awk -F'<value>|</value>' '{print $2}')
40
41 # Wait for the setup assistant to complete before continuing
42 log "Waiting for Setup Assistant"
43 loggedInUser=$(scutil <
'/'[:space:]+Name[:space:]:/
44 while [[ "$loggedInUser" == "_mb
45     /bin/sleep 5
46     loggedInUser=$(scutil <
'/'[:space:]+Name[:space:]:/
47 done
48
49 # Let's continue
50 log "Setup Assistant complete, co
51
52 if [[ "$computerName" == "" ]] ||
```

```
/usr/bin/awk -F': '
2 }}  ')
" | /usr/bin/awk -F': '
2 }}  ')
Please wait a moment...
```

And let's do an API read to retrieve all the Extension Attributes from that Mac's computer record in Jamf, dump it as XML to a variable and extract the value of the Name and Role attributes, feeding those to another pair of variables.

These variables will only be populated if we're re-provisioning an existing Mac where its old computer record is still in Jamf. In theory it should also work if these attributes have been set using Jamf's new inventory preload feature - but I haven't tried that yet.

If it's a new Mac, or we've deleted its computer record before we started, these variables will be empty.

```

36 log "Checking for existing Hostname and Role in JSS..."
37 exml=$(curl "$4"/JSSResource/computers/serialnumber/"$serial"/subset/extension_attributes -u
    "$5":"$6" -H "Accept: text/xml")
38 computerName=$(echo "$xml" | /usr/bin/xpath '//extension_attribute[name="Hostname"]' | /usr/bin/awk
    -F'<value>|</value>' '{print $2}')
39 computerRole=$(echo "$xml" | /usr/bin/xpath '//extension_attribute[name="Mac User Role"]' |
    /usr/bin/awk -F'<value>|</value>' '{print $2}')
40
41 # Wait for the setup assistant to complete before continuing
42 log "Waiting for Setup Assistant to complete..."
43 loggedInUser=$(scutil <<< "show State:/Users/ConsoleUser" | /usr/bin/awk -F': '
    '/[:space:]]+Name[:space:]:/ { if ( $2 != "loginwindow" ) { print $2 } }      ')
44 while [[ "$loggedInUser" == "_mbsetupuser" ]]; do
45     /bin/sleep 5
46     loggedInUser=$(scutil <<< "show State:/Users/ConsoleUser" | /usr/bin/awk -F': '
    '/[:space:]]+Name[:space:]:/ { if ( $2 != "loginwindow" ) { print $2 } }      ')
47 done
48
49 # Let's continue
50 log "Setup Assistant complete, continuing"
51
52 if [[ "$computerName" == "" ]] ||
53     log "Hostname or Role not set"
54
55 # Configure login window mech
56 /usr/local/bin/authchanger -r
57
58 # Kill the Login Window process
59 if pgrep loginwindow; then
60     /usr/bin/killall -HUP loginwindow
61 fi
62

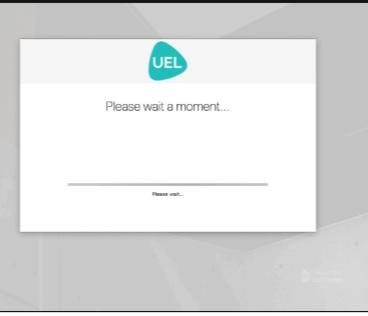

```

The terminal window shows the command `NoMADLoginAD:Notify take over`. A red oval highlights the section of the script where it checks for the presence of the '\_mbsetupuser' user in a while loop.

Before we continue, we need to check that the Setup Assistant isn't running. That's because policies that run with Jamf's enrolmentcomplete trigger can actually start before the Setup Assistant finishes, if you don't advance through all the steps quickly enough.

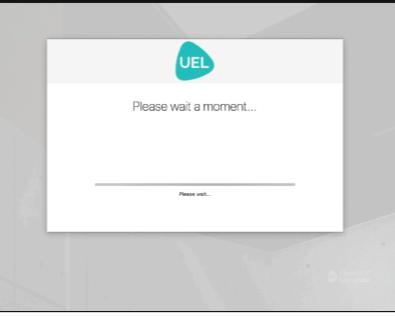

We can keep ourselves trapped in a while loop, checking the logged in username every 5 seconds - which will be \_mbsetupuser if the Setup Assistant is running. If the Setup Assistant isn't running, the logged in username will be empty and we'll carry on.

```
45     /bin/sleep 5
46     loggedInUser=$(/usr/sbin/scutil <<< "show State:/Users/ConsoleUser" | /usr/bin/awk -F': '
47     '/[:space:]+Name[:space:]:/{ if ( $2 != "loginwindow" ) { print $2 } }      ')
48 done
49 # Let's continue
50 log "Setup Assistant complete, continuing..."
51
52 if [[ "$computerName" == "" ]] || [[ "$computerRole" == "" ]]; then
53     log "Hostname or Role not set in JSS, configuring NoMAD Login with User Input and Notify mech..."
54
55     # Configure login window mech for User Input and Notify
56     /usr/local/bin/authchanger -reset -preLogin NoMADLoginAD:UserInput NoMADLoginAD:Notify
57
58     # Kill the Login Window process if it's running so NoMAD Login can take over
59     if pgrep loginwindow; then
60         /usr/bin/killall -HUP loginwindow
61     fi
62
63     # Wait for the user data to be submitted
64     while [ ! -f /var/tmp/userinfo ]; do
65         log "Waiting for user data submission..."
66         /bin/sleep 5
67     done
68
69     log "User data submitted, continuing..."
70
71     # Let's read the user data into variables
72     computerName=$(/usr/libexec/plistutil -c "print 'Computer Name'")
73     computerRole=$(/usr/libexec/plistutil -c "print 'Computer Role'")
74
75     # Update Hostname and Computer Role
```

After this, we'll check to see if the Computer Name and User Role values we collected earlier are empty. If they are, we need to get some user input from the person who's provisioning the Mac. Let's assume that's the case.

```
48
49 # Let's continue
50 log "Setup Assistant complete, continuing..."
51
52 if [[ "$computerName" == "" ]] || [[ "$computerRole" == "" ]]; then
53     log "Hostname or Role not set in JSS, configuring NoMAD Login with User Input and Notify mech..."
54
55     # Configure login window mech for User Input and Notify
56     /usr/local/bin/authchanger -reset -preLogin NoMADLoginAD:UserInput NoMADLoginAD:Notify
57
58     # Kill the Login Window process if it's running so NoMAD Login can take over
59     if pgrep loginwindow; then
60         /usr/bin/killall -HUP loginwindow
61     fi
62
63     # Wait for the user data to be submitted...
64     while [[ ! -f /var/tmp/userinputoutput.txt ]]; do
65         log "Waiting for user data..."
66         /bin/sleep 5
67     done
68
69     log "User data submitted, continuing..."
70
71     # Let's read the user data to use it later
72     computerName=$(/usr/libexec/ueleinquiry -c "print 'Computer Name'")
73     computerRole=$(/usr/libexec/ueleinquiry -c "print 'Computer Role'")
74
75     # Update Hostname and Computer Role
76     # Create xml
77     /bin/cat << EOF > /var/tmp/nomadconfig.xml
78     <computer>
79         <extension_attributes>
```

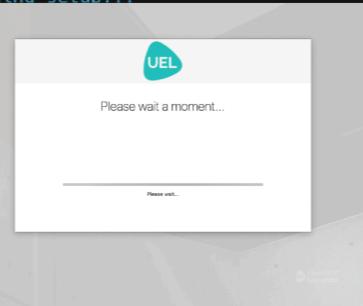

The terminal window shows the command `/usr/local/bin/authchanger -reset -preLogin NoMADLoginAD:UserInput NoMADLoginAD:Notify` being run. In the background, a small window titled "UEL" with the subtitle "Please wait a moment..." is displayed, indicating the process is in progress.

We'll use authchanger to switch NoMAD Login over to using its User Input mech.

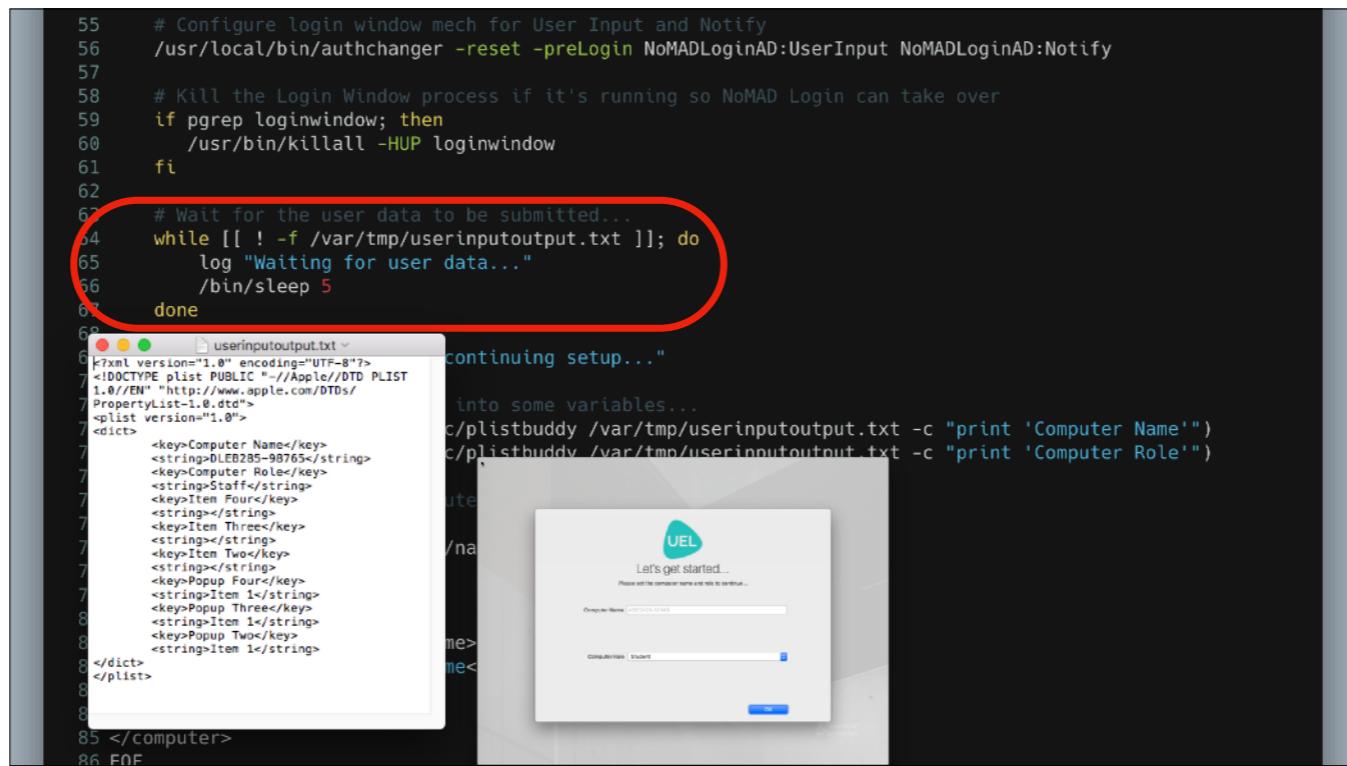

```
51
52 if [[ "$computerName" == "" ]] || [[ "$computerRole" == "" ]]; then
53     log "Hostname or Role not set in JSS, configuring NoMAD Login with User Input and Notify mech..."
54
55     # Configure login window mech for User Input and Notify
56     /usr/local/bin/authchanger -reset -preLogin NoMADLoginAD:UserInput NoMADLoginAD:Notify
57
58     # Kill the Login Window process if it's running so NoMAD Login can take over
59     if pgrep loginwindow; then
60         /usr/bin/killall -HUP loginwindow
61     fi
62
63     # Wait for the user data to be submitted...
64     while [[ ! -f /var/tmp/userinputoutput.txt ]]; do
65         log "Waiting for user data..."
66         /bin/sleep 5
67     done
68
69     log "User data submitted, continuing setup..."
70
71     # Let's read the user data in
72     computerName=$(./usr/libexec/pam_noma...t -c "print 'Computer Name'")
73     computerRole=$(./usr/libexec/pam_noma...t -c "print 'Computer Role'")
74
75     # Update Hostname and Compute
76     # Create xml
77     /bin/cat << EOF > /var/tmp/n...Please wait a moment...
78 <computer>
79     <extension_attributes>
80         <extension_attribute>
81             <name>Hostname</name>
82             <value>$computerName</value>

```

And we'll kill the loginwindow process to make NoMAD Login reload, where it'll show the User Input dialog.

```
55      # Configure login window mech for User Input and Notify
56      /usr/local/bin/authchanger -reset -preLogin NoMADLoginAD:UserInput NoMADLoginAD:Notify
57
58      # Kill the Login Window process if it's running so NoMAD Login can take over
59      if pgrep loginwindow; then
60          /usr/bin/killall -HUP loginwindow
61      fi
62
63      # Wait for the user data to be submitted...
64      while [ ! -f /var/tmp/userinputoutput.txt ]; do
65          log "Waiting for user data..."
66          /bin/sleep 5
67      done
68
69      continuing setup...
70      continuing setup...
71      continuing setup...
72      continuing setup...
73      continuing setup...
74      continuing setup...
75      continuing setup...
76      continuing setup...
77      continuing setup...
78      continuing setup...
79      continuing setup...
80      continuing setup...
81      continuing setup...
82      continuing setup...
83      continuing setup...
84      continuing setup...
85      continuing setup...
86      EOF
```

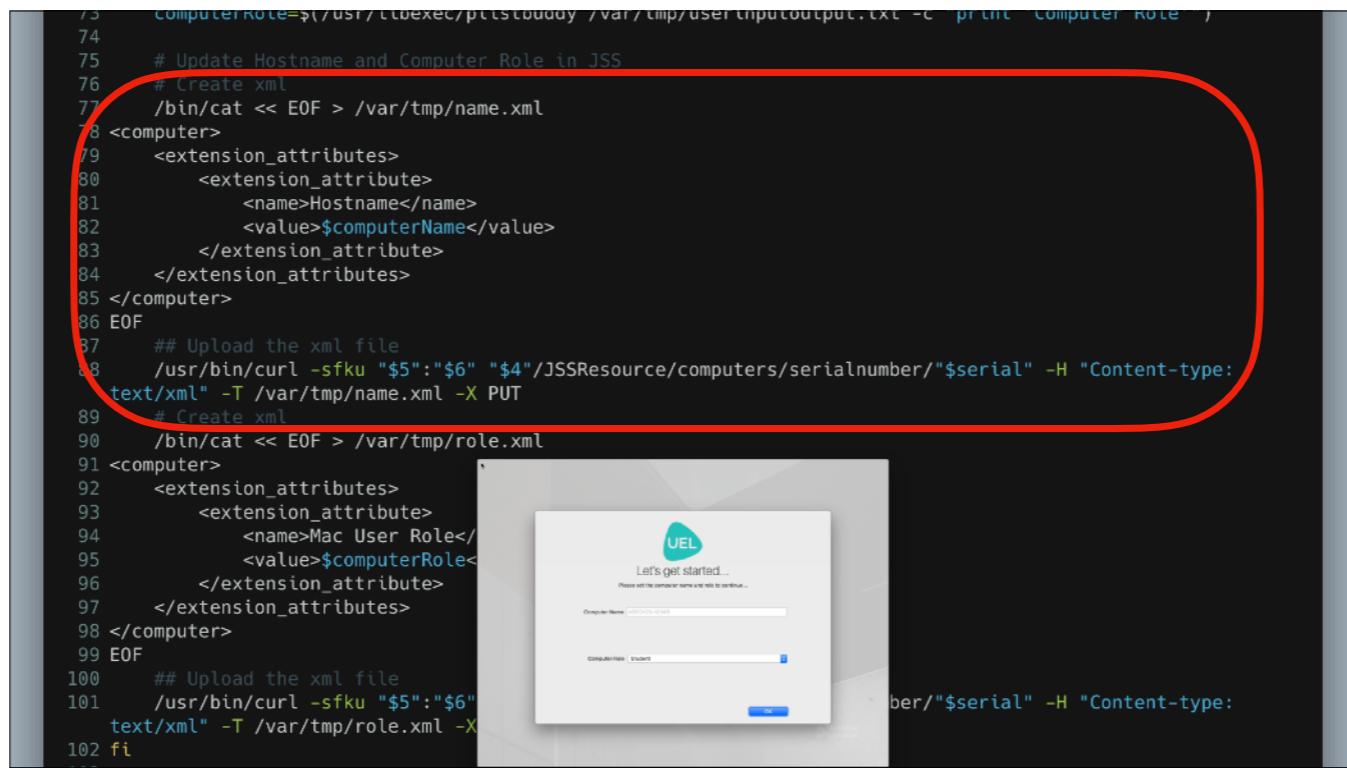

We'll wait until we the Computer Name and Role are submitted, which will be when our output file containing that data is created.

The screenshot shows a terminal window with a script running. The script is reading user input from a file named 'userinputoutput.txt'. Lines 72 and 73 are highlighted with a red oval, indicating they are the lines that read the 'Computer Name' and 'Computer Role' from the plist file. The terminal also shows the contents of the 'userinputoutput.txt' file, which is a plist file containing various keys like 'Computer Name', 'Computer Role', and 'extension\_attributes'.

```
63      # Wait for the user data to be submitted...
64      while [[ ! -f /var/tmp/userinputoutput.txt ]]; do
65          log "Waiting for user data..."
66          /bin/sleep 5
67      done
68
69      log "User data submitted, continuing setup..."
70
71      # Let's read the user data into some variables...
72      computerName=$(/usr/libexec/plistbuddy /var/tmp/userinputoutput.txt -c "print 'Computer Name'")
73      computerRole=$(/usr/libexec/plistbuddy /var/tmp/userinputoutput.txt -c "print 'Computer Role'")
74
75      # Update Hostname and Computer Role in JSS
76
77      #!/bin/bash
78      #!/usr/bin/python
79      #!/usr/bin/perl
80      #!/usr/bin/tclsh
81      #!/usr/bin/expect
82      #!/usr/bin/ssh
83      #!/usr/bin/sshpass
84      #!/usr/bin/nc
85      #!/usr/bin/openssl
86      #!/usr/bin/curl
87      #!/usr/bin/wget
88      #!/usr/bin/grep
89      #!/usr/bin/awk
90      #!/usr/bin/tr
91      #!/usr/bin/sed
92      #!/usr/bin/tee
93      #!/usr/bin/cat
94      #!/usr/bin/xargs
95      #!/usr/bin/true
96      #!/usr/bin/false
97      #!/usr/bin/echo
98      #!/usr/bin/printf
99      #!/usr/bin/echo
100     #!/usr/bin/printf
101
102     <extension_attributes>
103         <extension_attributes>
```

Then we'll read those name and role key values from that file into our computerName and computerRole variables in the script.

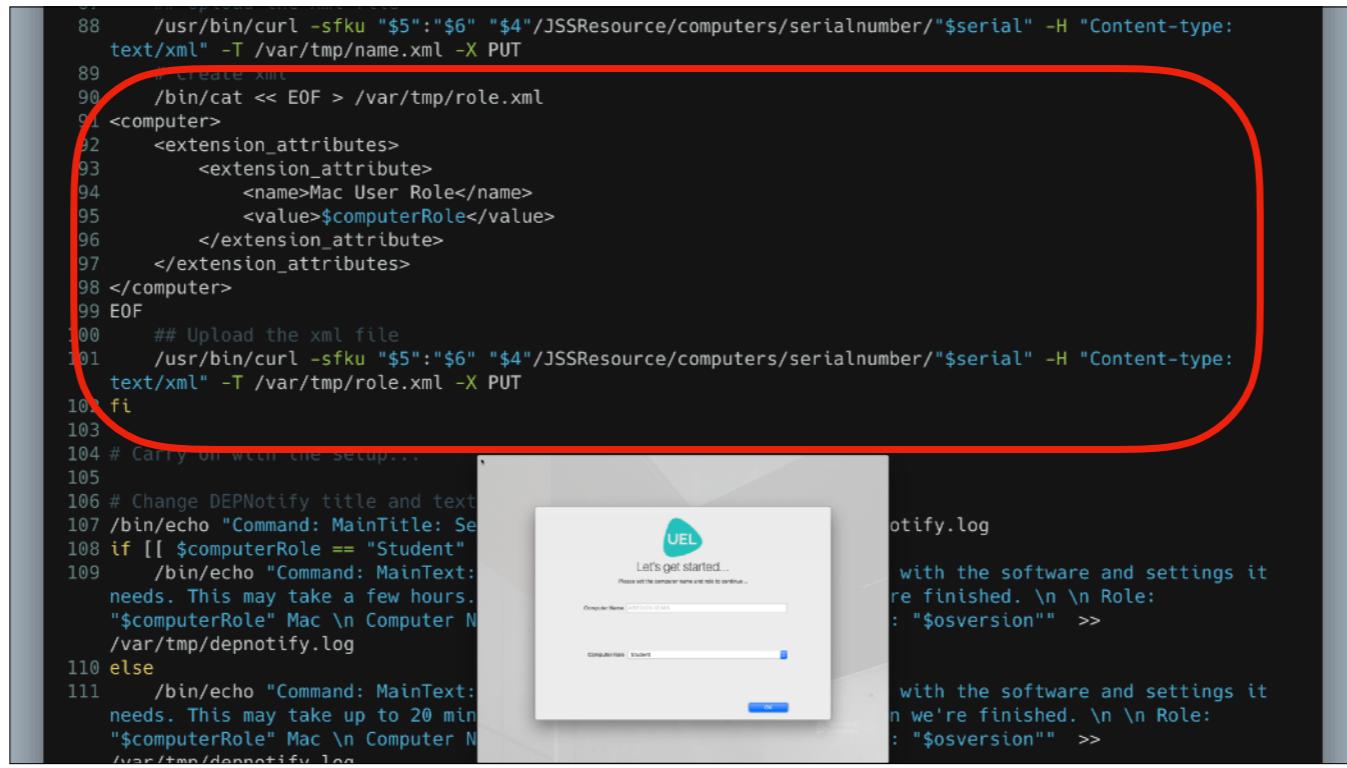

```
75     computerRole=$(/usr/libexec/plistbuddy /var/tmp/userInputOutput.txt -c "print Computer Role")
76
77     # Update Hostname and Computer Role in JSS

94             <name>Mac User Role</name>
95             <value>$computerRole</value>
96         </extension_attribute>
97     </extension_attributes>
98 </computer>
99 EOF
100    ## Upload the XML file
101    /usr/bin/curl -sfku "$5":"$6" "$4"/JSSResource/computers/serialnumber/"$serial" -H "Content-type: text/xml" -T /var/tmp/role.xml -X PUT
102 fi
103
104 # Carry on with the setup...
105
106 # Change DEPNotify title and text
107 /bin/echo "Command: MainTitle: Set
108 if [[ $computerRole == "Student"
109     /bin/echo "Command: MainText:
needs. This may take a few hours.
"$computerRole" Mac \n Computer N
/var/tmp/depnotify.log
110 else
111     /bin/echo "Command: MainText:
needs. This may take up to 20 min
"$computerRole" Mac \n Computer N
/usr/tmp/depnotify.log

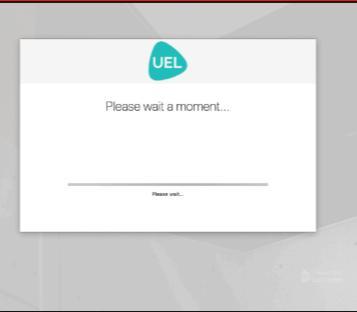

```

The terminal window shows a script for setting computer roles. Lines 90 through 103 are highlighted with a red oval. The script uses curl to upload an XML configuration to a JSS endpoint. Below the terminal is a screenshot of a software window titled 'UEL' with fields for 'Computer Name' and 'Computer Role' set to 'Student'. To the right is a log file named 'otify.log' showing the command being run.

We do the same for the User Role.

```
88     /usr/bin/curl -sfku "$5":"$6" "$4"/JSSResource/computers/serialnumber/"$serial" -H "Content-type: text/xml" -T /var/tmp/name.xml -X PUT
89     ## Create XML
90     /bin/cat << EOF > /var/tmp/role.xml
91 <computer>
92     <extension_attributes>
93         <extension_attribute>
94             <name>Mac User Role</name>
95             <value>$computerRole</value>
96         </extension_attribute>
97     </extension_attributes>
98 </computer>
99 EOF
100    ## Upload the XML file
101    /usr/bin/curl -sfku "$5":"$6" "$4"/JSSResource/computers/serialnumber/"$serial" -H "Content-type: text/xml" -T /var/tmp/role.xml -X PUT
102 fi
103
104 # Carry on with the setup...
105
106 # Change DEPNotify title and text
107 /bin/echo "Command: MainTitle: Set Computer Name"
108 if [[ $computerRole == "Student" ]]
109   /bin/echo "Command: MainText: Please enter the computer name. This may take a few hours. $computerRole Mac \n Computer Name" > /var/tmp/deponotify.log
110 else
111   /bin/echo "Command: MainText: Please enter the computer name. This may take up to 20 minutes. $computerRole Mac \n Computer Name" > /var/tmp/deponotify.log
```

The terminal window shows a script being run. A red oval highlights the section from line 88 to line 103. Below the terminal, a screenshot of a progress dialog box is displayed. The dialog has a blue header with the text 'UEL' and a progress bar below it. The main body of the dialog contains the text 'Please wait a moment...'. To the right of the dialog, there is a log file named 'otify.log' which contains the following text:

```
with the software and settings it
re finished. \n \n Role:
: "$osversion"  >>
with the software and settings it
n we're finished. \n \n Role:
: "$osversion"  >>
```

Then, it's time to carry on with the provisioning. The person doing this can walk away now because the rest is automated.

If our Computer Name and User Role extension attributes were already present in the computer record, we would have skipped that user input step and ended up straight here.

```
103
104 # Carry on with the setup...
105
106 # Change DEPNotify title and text...
107 /bin/echo "Command: MainTitle: Setting things up..." >> /var/tmp/depnotify.log
108 if [[ $computerRole == "Student" ]]; then
109     /bin/echo "Command: MainText: Please wait while we set this Mac up with the software and settings it
needs. This may take a few hours. We'll restart automatically when we're finished. \n \n Role:
$computerRole Mac \n Computer Name: \"$computerName\" \n macOS Version: \"$osversion\" " >>
/var/tmp/depnotify.log
110 else
111     /bin/echo "Command: MainText: Please wait while we set this Mac up with the software and settings it

128 /bin/echo "Status: Installing soft
```

So we carry on, using the same echo commands we would for DEPNotify.

We change title, main text and status to let us know what's happening. And we can make use of our Computer Name, Role and macOS version variables to provide some useful feedback in the text.

One thing I also do here is, if the Mac is student facing, change the main text so people know it's going to take a couple of hours vs 20 minutes for a staff facing Mac.

```
113
114 log "Initiating Configuration..."
115
116 # Time to set the hostname...
117 /bin/echo "Status: Setting computer name" >> /var/tmp/depnotify.log
118 log "Setting hostname to \"$computerName\"..."

```

And then, we can run other custom policy triggers. These could install software or do anything else we want.

In my environment, this Mac will be in the right smart groups for its campus, building and lab.

So what I do is have all my software install policies use the same custom trigger - Deploy - but scope them out to the smart groups for the labs or locations we want that software to be.

If you want more detail on that, check out this link.

What's also cool, is that the status text at the bottom of the Notify window will be updated from the Jamf log as various packages install.

```
129 /usr/local/bin/jamf policy -event Deploy
130 log "Software deployment policies done running"
131
132 # Run a recon, set asset tag and room number
133 /bin/echo "Status: Updating inventory..." >> /var/tmp/depnotify.log
134 log "Setting variables for asset tag and room..."
135 assetno=$(/bin/echo "$computerName" | /usr/bin/cut -d '-' -f 2)
136 room=$(/bin/echo "$computerName" | /usr/bin/cut -d '-' -f 1)
137 log "Running recon..."
138 /usr/local/bin/jamf recon -assetTag "$assetno" -room "$room"
139
140 # Run a Software Update
141 log "Running Apple Software Update..."
142 /usr/local/bin/jamf policy -event DeploySUS
143
144 # Finishing up
145
146 /bin/echo "Command: MainTitle: All done!" >> /var/tmp/depnotify.log
147 /bin/echo "Command: MainText: This Mac will restart shortly and you'll be able to log in. \n \n If you
    need any assistance, please contact servicedesk@uel.ac.uk" >> /var/tmp/depnotify.log
148 /bin/echo "Status: Restarting, pl
149
150 # Reset login window authentication

143  
144 # Finishing up  
145  
146 /bin/echo "Command: MainTitle: All done!" >> /var/tmp/depnotify.log  
147 /bin/echo "Command: MainText: This Mac will restart shortly and you'll be able to log in. \n \n If you  
    need any assistance, please contact the UEL IT Service Desk. \n \n Telephone: 020 8223 2468 \n Email:  
    servicedesk@uel.ac.uk" >> /var/tmp/depnotify.log  
148 /bin/echo "Status: Restarting, please wait..." >> /var/tmp/depnotify.log  
149  
150 # Reset login window authentication mech to Apple  
151 log "Resetting Login Window..."  
152 /usr/local/bin/authchanger -reset  
153  
154 # Kill caffeine and restart with it  
155 log "Decaffeinating..."  
156 log "Restarting in 2 minutes..."  
157 kill "$caffeinatepid"  
158 /sbin/shutdown -r +2 &  
159  
160 log "Done!"
```

We run a software update to catch any security updates or new versions of things like iTunes and Safari. I do call another policy to do this with a custom trigger because I had issues calling the softwareupdate command directly where the provisioning process would hang.

And we're finished, so we let people know, run authchanger to reset things back to using Apple's Login Window then restart with a 2 minute delay - so the policy has time to complete and write its log back to Jamf.

And we're finished, so we let people know, run authchanger to reset things back to using Apple's Login Window then restart with a 2 minute delay - so the policy has time to complete and write its log back to Jamf.

Meanwhile, we've all been at the pub... or attending conferences to learn about all the different things we can do to improve our MDM enrolment workflows...

# Thanks Joel!

I'd really like to thank Joel and everyone else who's contributed to these awesome tools for all their work. And especially for making it look like I know what I'm doing!

**Thank you!**

And thank you!
